RESEARCH EXPERIENCE

Colloids simulations

Studies of colloidal bidimensional systems using Brownian dynamics simulations and Green-Kubo relations. Structural and dynamical quantities were obtained under different interactions between particles and different area fraction occupied.

Lipid monolayers

Experimental studies of rheology of lipid monolayers with phase coexistence using Langmuir balance, optical microscopy and fluorescence microscopy. Differents interaction between domains of the condensed phase were studied as well as the diffusion of tracers (latex beads) on the monolayer in presence of these domains.

Image processing techniques

Simulation and classification of optical images. Comparison and quality quantification of different edge detectors; the widely known Canny and Sobel, and the wavelet based detectors Threshold Haar and Hidden Markov Model edge detectors.

Quantum Physics

Analytical and numerical studies on coherent dynamics of charge and spin excitations in one-dimensional systems. Studies of the effect of Markovian and Non-Markovian environments, mapping from many-body to one-body dynamics, injection condition in the Schrödinger equation, temporal reversion, and Loschmidt echoe.

Nuclear Magnetic Resonance Experiments

Development of a experiment leading to one-body dynamics using spin chains in crystal powders at room temperature. Multiple quantum coherences dynamics. Studies of decoherence through Loschmidt echoe and design of quantum channels.
