Tektronix warrants to the original end user purchaser (“original purchaser”) of the product listed below that the product will be free from defects in materials and workmanship for the lifetime of the product. As used herein, “lifetime of the product” is defined as a period ending five (5) years after Tektronix discontinues manufacturing the product (as determined by Tektronix), but the warranty period shall be at least ten (10) years from the date of purchase of the product by the original purchaser from Tektronix or an authorized Tektronix distributor. This limited lifetime warranty only applies to the original purchaser and is not transferable. In the event of a warranty claim under the limited lifetime warranty, the purchaser must provide satisfactory evidence of the date of purchase from Tektronix or an authorized Tektronix distributor and that it is the original purchaser. In the event of the sale or other transfer of the product by the original purchaser to a third party within three (3) years of the date of purchase of the product by the original purchaser, the warranty period shall be three (3) years from the date of purchase of the product by the original purchaser from Tektronix or an authorized Tektronix distributor. Probes and other accessories and batteries and fuses are not covered by this warranty.

If the product proves defective during the applicable warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement of an equivalent product (as determined by Tektronix) in exchange for the defective product. Parts, modules and replacement products used by Tektronix for warranty work may be new or reconditioned to like new performance. All replaced parts, modules and products become the property of Tektronix.

As used hereafter, “Customer” refers to the person or entity asserting rights under this warranty. In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the applicable warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, shipping charges prepaid and with a copy of proof of purchase by the original purchaser. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by accident, ordinary wear and tear of mechanical components, use outside of the product’s specifications, improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; c) to repair any damage or malfunction caused by the use of non-Tektronix supplies; or d) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX WITH RESPECT TO THE PRODUCT IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. TEKTRONIX AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF
MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX’ RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.
Tektronix warrants that this product will be free from defects in materials and workmanship for a period of one (1) year from the date of shipment. If any such product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product. Parts, modules and replacement products used by Tektronix for warranty work may be new or reconditioned to like new performance. All replaced parts, modules and products become the property of Tektronix.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, with shipping charges prepaid. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; c) to repair any damage or malfunction caused by the use of non-Tektronix supplies; or d) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX WITH RESPECT TO THE PRODUCT IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. TEKTRONIX AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX’ RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.

General Safety Summary

Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it.

To avoid potential hazards, use this product only as specified.

*Only qualified personnel should perform service procedures.*

**To Avoid Fire or Personal Injury**

**Use Proper Power Cord.** Use only the power cord specified for this product and certified for the country of use.

**Connect and Disconnect Properly.** Connect the probe output to the measurement instrument before connecting the probe to the circuit under test. Connect the probe reference lead to the circuit under test before connecting the probe input. Disconnect the probe input and the probe reference lead from the circuit under test before disconnecting the probe from the measurement instrument.

**Ground the Product.** This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

**Observe All Terminal Ratings.** To avoid fire or shock hazard, observe all ratings and markings on the product. Consult the product manual for further ratings information before making connections to the product.

Connect the probe reference lead to earth ground only.

Do not apply a potential to any terminal, including the common terminal, that exceeds the maximum rating of that terminal.

**Power Disconnect.** The power switch disconnects the product from the power source. See instructions for the location. Do not block the power switch; it must remain accessible to the user at all times.

**Do Not Operate Without Covers.** Do not operate this product with covers or panels removed.
Do Not Operate With Suspected Failures. If you suspect that there is damage to this product, have it inspected by qualified service personnel.

Avoid Exposed Circuitry. Do not touch exposed connections and components when power is present.

Do Not Operate in Wet/Damp Conditions.

Do Not Operate in an Explosive Atmosphere.

Keep Product Surfaces Clean and Dry.

Provide Proper Ventilation. Refer to the manual’s installation instructions for details on installing the product so it has proper ventilation.
Terms in this Manual

These terms may appear in this manual:

**WARNING.** Warning statements identify conditions or practices that could result in injury or loss of life.

**CAUTION.** Caution statements identify conditions or practices that could result in damage to this product or other property.

Symbols and Terms on the Product

These terms may appear on the product:

- **DANGER** indicates an injury hazard immediately accessible as you read the marking.
- **WARNING** indicates an injury hazard not immediately accessible as you read the marking.
- **CAUTION** indicates a hazard to property including the product.

The following symbol(s) may appear on the product:

- CAUTION Refer to Manual
- Protective Ground (Earth) Terminal
- Earth Terminal
- Chassis Ground
- Mains Disconnected OFF (Power)
- Mains Connected ON (Power)
Environmental Considerations

This section provides information about the environmental impact of the product.

Product End-of-Life Handling

Observe the following guidelines when recycling an instrument or component:

Equipment Recycling. Production of this equipment required the extraction and use of natural resources. The equipment may contain substances that could be harmful to the environment or human health if improperly handled at the product’s end of life. In order to avoid release of such substances into the environment and to reduce the use of natural resources, we encourage you to recycle this product in an appropriate system that will ensure that most of the materials are reused or recycled appropriately.

The symbol shown below indicates that this product complies with the European Union’s requirements according to Directive 2002/96/EC on waste electrical and electronic equipment (WEEE). For information about recycling options, check the Support/Service section of the Tektronix Web site (www.tektronix.com).

Mercury Notification. This product uses an LCD backlight lamp that contains mercury. Disposal may be regulated due to environmental considerations. Please contact your local authorities or, within the United States, the Electronics Industries Alliance (www.eiae.org) for disposal or recycling information.
Environmental Considerations

**Restriction of Hazardous Substances**

This product has been classified as Monitoring and Control equipment, and is outside the scope of the 2002/95/EC RoHS Directive. This product is known to contain lead, cadmium, mercury, and hexavalent chromium.
This manual contains operating information for the TDS1000B and TDS2000B Series Digital Storage Oscilloscopes. The manual consists of the following chapters:

- The *Getting Started* chapter briefly describes features of the oscilloscope and provides installation instructions.
- The *Operating Basics* chapter covers operating principles of the oscilloscopes.
- The *Understanding Oscilloscope Functions* chapter describes basic operations and functions of an oscilloscope: setting up the oscilloscope, triggering, acquiring data, scaling and positioning waveforms, and taking measurements.
- The *Application Examples* chapter provides examples on how to solve a variety of measurement problems.
- The *Math FFT* chapter describes how to use the Math Fast Fourier Transform function to convert a time-domain signal into its frequency components (spectrum).
- The *USB Flash Drive and Device Ports* chapter describes how to use the USB Flash Drive port and how to connect the oscilloscope to printers and computers through the USB Device port.
- The *Reference* chapter describes the selections or available range of values for each option.
- The *Appendix A: Specifications* chapter includes electrical, environmental, and physical specifications for the oscilloscope and the P2220 probe, as well as certifications and compliances.
- The *Appendix B: Accessories* chapter briefly describes standard and optional accessories.
- The *Appendix C: Cleaning* chapter describes how to take care of the oscilloscope.
- The *Appendix D: Default Setup* chapter contains a list of the menus and controls with the default (factory) settings that are recalled when you push the DEFAULT SETUP front-panel button.
The Appendix E: Font Licenses chapter provides the licenses to use specific Asian fonts.

Help System

The oscilloscope has a Help system with topics that cover all the features of the oscilloscope. You can use the Help system to display several kinds of information:

- General information about understanding and using the oscilloscope, such as Using the Menu System.
- Information about specific menus and controls, such as the Vertical Position Control.
- Advice about problems you may face while using an oscilloscope, such as Reducing Noise.

The Help system provides several ways to find the information you need: context-sensitive help, hyperlinks, and an index.

Context-Sensitive Help

The oscilloscope displays information about the last menu displayed on the screen when you push the HELP front-panel button. When viewing help topics, an LED lights next to the multipurpose knob to indicate that the knob is active. If the topic uses more than one page, turn the multipurpose knob to move from page to page within the topic.

Hyperlinks

Most of the help topics contain phrases marked with angle brackets, such as <Autoset>. These are links to other topics. Turn the multipurpose knob to move the highlight from one link to another. Push the Show Topic option button to display the topic corresponding to the highlighted link. Push the Back option button to return to the previous topic.
Index

Push the front-panel HELP button, then push the Index option button. Push the Page Up or Page Down option buttons until you find the index page that contains the topic you want to view. Turn the multipurpose knob to highlight a help topic. Push the Show Topic option button to display the topic.

NOTE. Push the Exit option button or any menu button to remove the Help text from the screen and return to displaying waveforms.

Firmware Updates Through the Internet

If a newer version of firmware becomes available, you can use the Internet and a USB flash drive to update your oscilloscope. If you do not have access to the Internet, contact Tektronix for information on update procedures.

To update the firmware from the Internet, follow these steps:

1. Push the UTILITY ► System Status option, and write down the firmware version number of the oscilloscope.

2. From your computer, access the www.tektronix.com web site and check if a newer version of oscilloscope firmware is available.

3. If there is a newer version of firmware, download the firmware file from the web page.
   You may need to unzip the downloaded file.

4. Copy the TDS1K2KB.TEK firmware file to the root folder of a USB flash drive.

5. Insert the USB flash drive into the USB Flash Drive port on the front of the oscilloscope.

6. From your oscilloscope, push the UTILITY ► File Utilities ► - more - page 2 of 2 ► Update Firmware option button.
   It takes several minutes to update the firmware.

   Your oscilloscope will prompt you to press a button when the firmware update is complete. You must not remove the USB flash drive, or power off the oscilloscope until the firmware update is complete.
Conventions

This manual uses the following conventions:

- Front-panel buttons, knobs and connectors appear in all uppercase letters. For example: HELP, PRINT.

- Menu options appear with the first letter of each word in upper case. For example: Peak Detect, Window Zone.

**NOTE.** Option buttons may also be called screen buttons, side-menu buttons, bezel buttons, or soft keys.

- The ► delimiter separates a series of button pushes. For example, **UTILITY ► Options ► Set Date and Time** means that you push the UTILITY front-panel button, then push the Options option button, and then push the Set Date and Time option button. Multiple pushes of an option button may be required to select the desired option.
Getting Started

TDS1000B and TDS2000B Series Digital Storage Oscilloscopes are small, lightweight, benchtop oscilloscope you can use to take ground-referenced measurements.

This chapter describes how to do the following tasks:

- Install your product
- Perform a brief functional check
- Perform a probe check and compensate probes
- Match your probe attenuation factor
- Use the self calibration routine

**NOTE.** You can select a language to display on the screen when you power on the oscilloscope. At any time, you can also access the UTILITY►Language option to select a language.

General Features

The next table and list describe the general features.

</tbody>
</table>
Getting Started

- Context-sensitive help system
- Color or monochrome LCD display
- Selectable 20 MHz bandwidth limit
- 2500 point record length for each channel
- Autoset
- Autoranging
- Probe Check Wizard
- Setup and waveform storage
- USB Flash Drive port for file storage
- Direct printing to any PictBridge compatible printer
- PC communications through the USB Device port with OpenChoice PC Communications software
- Connect to a GPIB controller through an optional TEK-USB-488 adapter
- Cursors with readouts
- Trigger frequency readout
- Eleven automatic measurements
- Waveform averaging and peak detection
- Dual time base
- Math functions: +, -, and × operations
- Math Fast Fourier Transform (FFT)
- Pulse Width trigger capability
- Video trigger capability with line-selectable triggering
- External trigger
- Variable persistence display
- User interface and help topics in ten languages
Installation

**Power Cord**

Use only the power cord provided with your oscilloscope. *Appendix B: Accessories* lists the standard and the optional accessories.

**Power Source**

Use a power source that delivers 90 to 264 VAC\(_{\text{RMS}}\), 45 to 66 Hz. If you have a 400 Hz power source, it must deliver 90 to 132 VAC\(_{\text{RMS}}\), 360 to 440 Hz.

**Security Loop**

Use a standard laptop computer security lock, or thread a security cable through the built-in cable channel to secure your oscilloscope to your location.

![Security Loop Diagram]

**Ventilation**

*NOTE.* The oscilloscope cools by convection. Keep two inches clear on the sides and top of the product to allow adequate air flow.
Functional Check

Perform this functional check to verify that your oscilloscope is operating correctly.

1. Power on the oscilloscope. Push the DEFAULT SETUP button. The default Probe option attenuation setting is 10X.

2. Set the switch to 10X on the P2220 probe and connect the probe to channel 1 on the oscilloscope. To do this, align the slot in the probe connector with the key on the CH 1 BNC, push to connect, and twist to the right to lock the probe in place. Connect the probe tip and reference lead to the PROBE COMP terminals.

3. Push the AUTOSET button. Within a few seconds, you should see a square wave in the display of about 5V peak-to-peak at 1 kHz. Push the CH1 MENU button on the front panel twice to remove channel 1, push the CH 2 MENU button to display channel 2, and repeat steps 2 and 3. For 4-channel models, repeat for CH 3 and CH 4.
Getting Started

Probe Safety

Check and observe probe ratings before using probes.

A guard around the P2220 probe body provides a finger barrier for protection from electric shock.

![Finger guard]

**WARNING.** To avoid electric shock when using the probe, keep fingers behind the guard on the probe body.

To avoid electric shock while using the probe, do not touch metallic portions of the probe head while it is connected to a voltage source.

Connect the probe to the oscilloscope, and connect the ground terminal to ground before you take any measurements.

Voltage Probe Check Wizard

You can use the Probe Check Wizard to verify that a voltage probe is operating properly. The wizard does not support current probes.

The wizard helps you adjust the compensation for voltage probes (usually with a screw on the probe body or probe connector) and set the factor for the Attenuation option for each channel, such as in the CH 1 MENU ► Probe ► Voltage ► Attenuation option.
You should use the Probe Check Wizard each time you connect a voltage probe to an input channel.

To use the Probe Check Wizard, push the probe check button. If the voltage probe is connected properly, compensated properly, and the Attenuation option in the oscilloscope vertical menu is set to match the probe, the oscilloscope displays a PASSED message at the bottom of the screen. Otherwise, the oscilloscope displays directions on the screen to guide you in correcting these problems.

**NOTE.** The Probe Check Wizard is useful for 1X, 10X, 20X, 50X, and 100X probes. It is not useful for 500X or 1000X probes, or for probes connected to the EXT TRIG BNC.

**NOTE.** When the process is complete, the Probe Check Wizard restores the oscilloscope settings (other than the Probe option) to what they were before you pushed the PROBE CHECK button.

To compensate a probe that you plan to use with the EXT TRIG input, follow these steps:

1. Connect the probe to any input channel BNC, such as to CH 1.
2. Push the PROBE CHECK button and follow the directions on the screen.
3. After you verify that the probe functions and is compensated properly, connect the probe to the EXT TRIG BNC.
Manual Probe Compensation

As an alternative method to the Probe Check Wizard, you can manually perform this adjustment to match your probe to the input channel.

1. Push the CH 1 MENU ➤ Probe ➤ Voltage ➤ Attenuation option and select 10X. Set the switch to 10X on the P2220 probe and connect the probe to channel 1 on the oscilloscope. If you use the probe hook-tip, ensure a proper connection by firmly inserting the tip onto the probe.

2. Attach the probe tip to the PROBE COMP ~5V@1kHz terminal and the reference lead to the PROBE COMP chassis terminal. Display the channel, and then push the AUTOSET button.

3. Check the shape of the displayed waveform.

4. If necessary, adjust your probe. The P2220 probe is shown. Repeat as necessary.
Probe Attenuation Setting

Probes are available with various attenuation factors which affect the vertical scale of the signal. The Probe Check Wizard verifies that the attenuation factor in the oscilloscope matches the probe.

As an alternative method to Probe Check, you can manually select the factor that matches the attenuation of your probe. For example, to match a probe set to 10X connected to CH 1, push the CH 1 MENU ➤ Probe ➤ Voltage ➤ Attenuation option, and select 10X.

*NOTE.* The default setting for the Attenuation option is 10X.

If you change the Attenuation switch on the P2220 probe, you also need to change the oscilloscope Attenuation option to match. Switch settings are 1X and 10X.

![Attenuation switch](image)

*NOTE.* When the Attenuation switch is set to 1X, the P2220 probe limits the bandwidth of the oscilloscope to 6 MHz. To use the full bandwidth of the oscilloscope, be sure to set the switch to 10X.

Current Probe Scaling

Current probes provide a voltage signal proportional to the current. You need to set the oscilloscope to match the scale of your current probe. The default scale is 10 A/V.

For example, to set the scale for a current probe connected to CH 1, push the CH 1 MENU ➤ Probe ➤ Current ➤ Scale option, and select an appropriate value.
Self Calibration

The self calibration routine lets you optimize the oscilloscope signal path for maximum measurement accuracy. You can run the routine at any time but you should always run the routine if the ambient temperature changes by 5 °C (9 °F) or more. The routine takes about two minutes.

For accurate calibration, power on the oscilloscope and wait twenty minutes to ensure it is warmed up.

To compensate the signal path, disconnect any probes or cables from the input connectors. Then, access the **UTILITY ► Do Self Cal** option, and follow the directions on the screen.
Operating Basics

The front panel is divided into easy-to-use functional areas. This chapter provides you with a quick overview of the controls and the information displayed on the screen.

2-channel model

4-channel model
Display Area

In addition to displaying waveforms, the display is filled with many details about the waveform and the oscilloscope control settings.

**NOTE.** For details on displaying the FFT function, (See page 69, Displaying the FFT Spectrum.)

1. Icon display shows acquisition mode.

- Sample mode
- Peak detect mode
- Average mode
2. Trigger status indicates the following:

- **Armed.** The oscilloscope is acquiring pretrigger data. All triggers are ignored in this state.
- **Ready.** All pretrigger data has been acquired and the oscilloscope is ready to accept a trigger.
- **Trig’d.** The oscilloscope has seen a trigger and is acquiring the posttrigger data.
- **Stop.** The oscilloscope has stopped acquiring waveform data.
- **Acq. Complete** The oscilloscope has completed a Single Sequence acquisition.
- **Auto.** The oscilloscope is in auto mode and is acquiring waveforms in the absence of triggers.
- **Scan.** The oscilloscope is acquiring and displaying waveform data continuously in scan mode.

3. Marker shows horizontal trigger position. Turn the HORIZONTAL POSITION knob to adjust the position of the marker.

4. Readout shows the time at the center graticule. The trigger time is zero.

5. Marker shows Edge or Pulse Width trigger level.

6. On-screen markers show the ground reference points of the displayed waveforms. If there is no marker, the channel is not displayed.

7. An arrow icon indicates that the waveform is inverted.

8. Readouts show the vertical scale factors of the channels.

9. A $B_W$ icon indicates that the channel is bandwidth limited.

10. Readout shows main time base setting.

11. Readout shows window time base setting if it is in use.

12. Readout shows trigger source used for triggering.

13. Icon shows selected trigger type as follows:
Operating Basics

Edge trigger for the rising edge.

Edge trigger for the falling edge.

Video trigger for line sync.

Video trigger for field sync.

Pulse Width trigger, positive polarity.

Pulse Width trigger, negative polarity.

14. Readout shows Edge or Pulse Width trigger level.

15. Display area shows helpful messages; some messages display for only three seconds.

If you recall a saved waveform, readout shows information about the reference waveform, such as RefA 1.00V 500µs.

16. Readout shows date and time.

17. Readout shows trigger frequency.

Message Area

The oscilloscope displays a message area (item number 15 in the previous figure) at the bottom of the screen that conveys the following types of helpful information:

- Directions to access another menu, such as when you push the TRIG MENU button:
  
  For TRIGGER HOLDOFF, go to HORIZONTAL MENU

- Suggestion of what you might want to do next, such as when you push the MEASURE button:

  Push an option button to change its measurement

- Information about the action the oscilloscope performed, such as when you push the DEFAULT SETUP button:

  Default setup recalled

- Information about the waveform, such as when you push the AUTOSET button:

  Square wave or pulse detected on CH1
Using the Menu System

The user interface of the oscilloscopes was designed for easy access to specialized functions through the menu structure.

When you push a front-panel button, the oscilloscope displays the corresponding menu on the right side of the screen. The menu shows the options that are available when you push the unlabeled option buttons directly to the right of the screen.

The oscilloscope uses several methods to display menu options:

- **Page (Submenu) Selection:** For some menus, you can use the top option button to choose two or three submenus. Each time you push the top button, the options change. For example, when you push the top button in the TRIGGER Menu, the oscilloscope cycles through the Edge, Video, and Pulse Width trigger submenus.

- **Circular List:** The oscilloscope sets the parameter to a different value each time you push the option button. For example, you can push the CH 1 MENU button and then push the top option button to cycle through the Vertical (channel) Coupling options.

In some lists, you can use the multipurpose knob to select an option. A hint line tells you when the multipurpose knob can be used, and an LED by the multipurpose knob lights when the knob is active. (See page 19, Menu and Control Buttons.)

- **Action:** The oscilloscope displays the type of action that will immediately occur when you push an Action option button. For example, when the Help Index is visible, and you push the Page Down option button, the oscilloscope immediately displays the next page of index entries.

- **Radio:** The oscilloscope uses a different button for each option. The currently-selected option is highlighted. For example, the oscilloscope displays various acquisition mode options when you push the ACQUIRE Menu button. To select an option, push the corresponding button.
Vertical Controls

All models, 4-channel shown

POSITION (CH 1, CH 2, CH 3 & CH 4).  Positions a waveform vertically.

CH 1, CH 2, CH 3 & CH 4 MENU.  Displays the Vertical menu selections and toggles the display of the channel waveform on and off.
VOLTS/DIV (CH 1, CH 2, CH 3 & CH 4). Selects vertical scale factors.

MATH MENU. Displays waveform math operations menu and toggles the display of the math waveform on and off.

Horizontal Controls

2-channel model 4-channel model

POSITION. Adjusts the horizontal position of all channel and math waveforms. The resolution of this control varies with the time base setting. (See page 109, Window Zone.)

NOTE. To make a large adjustment to the horizontal position, turn the SEC/DIV knob to a larger value, change the horizontal position, and then turn the SEC/DIV knob back to the previous value.

HORIZ MENU. Displays the Horizontal Menu.

SET TO ZERO. Sets the horizontal position to zero.

SEC/DIV. Selects the horizontal time/div (scale factor) for the main or the window time base. When Window Zone is enabled, it changes the width of the window zone by changing the window time base. (See page 109, Window Zone.)
Trigger Controls

2-channel model

**LEVEL.** When you use an Edge or Pulse trigger, the LEVEL knob sets the amplitude level that the signal must cross to acquire a waveform.

**TRIG MENU.** Displays the Trigger Menu.

**SET TO 50%.** The trigger level is set to the vertical midpoint between the peaks of the trigger signal.

**FORCE TRIG.** Completes an acquisition regardless of an adequate trigger signal. This button has no effect if the acquisition is already stopped.

**TRIG VIEW.** Displays the trigger waveform in place of the channel waveform while you hold down the TRIG VIEW button. Use this to see how the trigger settings affect the trigger signal, such as trigger coupling.
Menu and Control Buttons

Refer to the *Reference* chapter for detailed information on the menu and button controls.

**Multipurpose Knob.** The function is determined by the displayed menu or selected menu option. When active, the adjacent LED lights. The next table lists the functions.

► Voltage ► Attenuation

Vertical ► Probe           Value entry  For a channel menu (such as the CH 1 MENU), sets the scale in the oscilloscope
► Current ► Scale

AUTORANGE. Displays the Autorange Menu, and activates or deactivates the autoranging function. When autoranging is active, the adjacent LED lights.

SAVE/RECALL. Displays the Save/Recall Menu for setups and waveforms.

MEASURE. Displays the automated measurements menu.

ACQUIRE. Displays the Acquire Menu.

REF MENU. Displays the Reference Menu to quickly display and hide reference waveforms stored in the oscilloscope non-volatile memory.

UTILITY. Displays the Utility Menu.

CURSOR. Displays the Cursor Menu. Cursors remain visible (unless the Type option is set to Off) after you leave the Cursor Menu but are not adjustable.

DISPLAY. Displays the Display Menu.

HELP. Displays the Help Menu.

DEFAULT SETUP. Recalls the factory setup.

AUTOSET. Automatically sets the oscilloscope controls to produce a usable display of the input signals.

SINGLE SEQ. Acquires a single waveform and then stops.
RUN/STOP. Continuously acquires waveforms or stops the acquisition.

PRINT. Starts the print operation to a PictBridge compatible printer, or performs the SAVE function to the USB flash drive.

SAVE. An LED indicates when the PRINT button is configured to save data to the USB flash drive.

Input Connectors

2-channel model

CH 1, CH 2, CH 3 & CH 4. Input connectors for waveform display.

EXT TRIG. Input connector for an external trigger source. Use the Trigger Menu to select the Ext, or Ext/5 trigger source. Push and hold the TRIG VIEW button to see how the trigger settings affect the trigger signal, such as trigger coupling.

4-channel model
Other Front-Panel Items

**USB Flash Drive Port.** Insert a USB flash drive for data storage or retrieval. The oscilloscope displays a clock symbol to indicate when the flash drive is active. After a file is saved or retrieved, the oscilloscope removes the clock, and displays a hint line to notify you that the save or recall operation is complete.

For flash drives with an LED, the LED blinks when saving data to or retrieving data from the drive. Wait until the LED stops to remove the drive.

**PROBE COMP.** Probe compensation output and chassis reference. Use to electrically match a voltage probe to the oscilloscope input circuit. (See page 5, *Voltage Probe Check Wizard.*)(See page 7, *Manual Probe Compensation.*)
Understanding Oscilloscope Functions

This chapter contains general information that you need to understand before you use an oscilloscope. To use your oscilloscope effectively, you need to learn about the following functions:

- Setting up the oscilloscope
- Triggering
- Acquiring signals (waveforms)
- Scaling and positioning waveforms
- Measuring waveforms

The next figure shows a block diagram of the various functions of the oscilloscope and their relationships to each other.

Setting Up the Oscilloscope

You should become familiar with several functions that you may use often when operating your oscilloscope: Autoset, Autorange, saving a setup, and recalling a setup.
Understanding Oscilloscope Functions

Using Autoset
Each time you push the AUTOSET button, the Autoset function obtains a stable waveform display for you. It automatically adjusts the vertical scale, horizontal scale and trigger settings. Autoset also displays several automatic measurements in the graticule area, depending on the signal type.

Using Autorange
Autorange is a continuous function that you can enable or disable. The function adjusts setup values to track a signal when the signal exhibits large changes or when you physically move the probe to a different point.

Saving a Setup
The oscilloscope saves the current setup if you wait five seconds after the last change before you power off the oscilloscope. The oscilloscope recalls this setup the next time you apply power.

You can use the SAVE/RECALL Menu to save up to ten different setups. You can also save setups to a USB flash drive. The oscilloscope accommodates a USB flash drive for removable data storage and retrieval. (See page 77, USB Flash Drive Port.)

Recalling a Setup
The oscilloscope can recall the last setup before the oscilloscope was powered off, any saved setups, or the default setup. (See page 114, Save/Recall.)

Default Setup
The oscilloscope is set up for normal operation when it is shipped from the factory. This is the default setup. To recall this setup, push the DEFAULT SETUP button. To view the default settings, refer to Appendix D: Default Setup.

Triggering
The trigger determines when the oscilloscope starts to acquire data and to display a waveform. When a trigger is set up properly, the
oscilloscope converts unstable displays or blank screens into meaningful waveforms.

![Triggered waveform](image1.png) ![Untriggered waveforms](image2.png)

For oscilloscope-specific descriptions, refer to the *Operating Basics* chapter. (See page 18, *Trigger Controls.*) Refer also to the *Reference* chapter. (See page 121, *Trigger Controls.*)

When you push the RUN/STOP or SINGLE SEQ button to start an acquisition, the oscilloscope goes through the following steps:

1. Acquires enough data to fill the portion of the waveform record to the left of the trigger point. This is called the pretrigger.
2. Continues to acquire data while waiting for the trigger condition to occur.
3. Detects the trigger condition.
4. Continues to acquire data until the waveform record is full.
5. Displays the newly-acquired waveform.

**NOTE.** For Edge and Pulse triggers, the oscilloscope counts the rate at which trigger events occur to determine trigger frequency. The oscilloscope displays the frequency in the lower right corner of the screen.

**Source**

You can use the Trigger Source options to select the signal that the oscilloscope uses as a trigger. The source can be the AC power line (available only with Edge triggers), or any signal connected to a channel BNC or to the EXT TRIG BNC.
Understanding Oscilloscope Functions

**Types**

The oscilloscope provides three types of triggers: Edge, Video, and Pulse Width.

**Modes**

You can select the Auto or the Normal trigger mode to define how the oscilloscope acquires data when it does not detect a trigger condition. (See page 122, *Mode Options*.)

To perform a single sequence acquisition, push the SINGLE SEQ button.

**Coupling**

You can use the Trigger Coupling option to determine which part of the signal will pass to the trigger circuit. This can help you attain a stable display of the waveform.

To use trigger coupling, push the TRIG MENU button, select an Edge or Pulse trigger, and select a Coupling option.

*NOTE.* Trigger coupling affects only the signal passed to the trigger system. It does not affect the bandwidth or coupling of the signal displayed on the screen.

To view the conditioned signal being passed to the trigger circuit, push and hold down the TRIG VIEW button.

**Position**

The horizontal position control establishes the time between the trigger and the screen center. Refer to *Horizontal Scale and Position; Pretrigger Information* for information on how to use this control to position the trigger. (See page 30, *Horizontal Scale and Position; Pretrigger Information*.)

**Slope and Level**

The Slope and Level controls help to define the trigger. The Slope option (Edge trigger type only) determines whether the oscilloscope finds the trigger point on the rising or the falling edge of a signal. The TRIGGER LEVEL knob controls where on the edge the trigger point occurs.
Understanding Oscilloscope Functions

Acquiring Signals

When you acquire a signal, the oscilloscope converts it into a digital form and displays a waveform. The acquisition mode defines how the signal is digitized, and the time base setting affects the time span and level of detail in the acquisition.

Acquisition Modes

There are three acquisition modes: Sample, Peak Detect, and Average.

Sample. In this acquisition mode, the oscilloscope samples the signal in evenly spaced intervals to construct the waveform. This mode accurately represents signals most of the time. However, this mode does not acquire rapid variations in the signal that may occur between samples. This can result in aliasing, and may cause narrow pulses to be missed. In these cases, you should use the Peak Detect mode to acquire data. (See page 31, Time Domain Aliasing.)

Peak Detect. In this acquisition mode, the oscilloscope finds the highest and lowest values of the input signal over each sample interval and uses these values to display the waveform. In this way, the oscilloscope can acquire and display narrow pulses, which may have otherwise been missed in Sample mode. Noise will appear to be higher in this mode.

Average. In this acquisition mode, the oscilloscope acquires several waveforms, averages them, and displays the resulting waveform. You can use this mode to reduce random noise.
Understanding Oscilloscope Functions

**Time Base**

The oscilloscope digitizes waveforms by acquiring the value of an input signal at discrete points. The time base allows you to control how often the values are digitized.

To adjust the time base to a horizontal scale that suits your purpose, use the SEC/DIV knob.

**Scaling and Positioning Waveforms**

You can change the display of waveforms by adjusting the scale and position. When you change the scale, the waveform display will increase or decrease in size. When you change the position, the waveform will move up, down, right, or left.

The channel indicator (located on the left of the graticule) identifies each waveform on the display. The indicator points to the ground reference level of the waveform record.

You can view the display area and readouts. (See page 12, *Display Area.*)

**Vertical Scale and Position**

You can change the vertical position of waveforms by moving them up or down in the display. To compare data, you can align a waveform above another or you can align waveforms on top of each other.

You can change the vertical scale of a waveform. The waveform display will contract or expand relative to the ground reference level.

For oscilloscope-specific descriptions, refer to the *Operating Basics* chapter. (See page 16, *Vertical Controls.*) Refer also to the *Reference* chapter. (See page 132, *Vertical Controls.*)

**Horizontal Scale and Position; Pretrigger Information**

You can adjust the HORIZONTAL POSITION control to view waveform data before the trigger, after the trigger, or some of each. When you change the horizontal position of a waveform, you are actually changing the time between the trigger and the center of the display. (This appears to move the waveform to the right or left on the display.)
For example, if you want to find the cause of a glitch in your test circuit, you might trigger on the glitch and make the pretrigger period large enough to capture data before the glitch. You can then analyze the pretrigger data and perhaps find the cause of the glitch.

You change the horizontal scale of all the waveforms by turning the SEC/DIV knob. For example, you might want to see just one cycle of a waveform to measure the overshoot on its rising edge.

The oscilloscope shows the horizontal scale as time per division in the scale readout. Since all active waveforms use the same time base, the oscilloscope only displays one value for all the active channels, except when you use Window Zone. Refer to Window Zone for information on how to use the window function. (See page 109, Window Zone.)

For oscilloscope-specific descriptions, refer to the Operating Basics chapter. (See page 17, POSITION.) Refer also to the Reference chapter. (See page 107, Horizontal.)

**Time Domain Aliasing.** Aliasing occurs when the oscilloscope does not sample the signal fast enough to construct an accurate waveform record. When this happens, the oscilloscope displays a waveform with a frequency lower than the actual input waveform, or triggers and displays an unstable waveform.

The oscilloscope accurately represents signals, but is limited by the probe bandwidth, the oscilloscope bandwidth, and the sample rate. To avoid aliasing, the oscilloscope must sample the signal more than twice as fast as the highest frequency component of the signal.

The highest frequency that the oscilloscope sampling rate can theoretically represent is the Nyquist frequency. The sample rate is called the Nyquist rate, and is twice the Nyquist frequency.
Understanding Oscilloscope Functions

The oscilloscope maximum sample rates are at least ten times the bandwidth. These high sample rates help reduce the possibility of aliasing.

There are several ways to check for aliasing:

- Turn the SEC/DIV knob to change the horizontal scale. If the shape of the waveform changes drastically, you may have aliasing.

- Select the Peak Detect acquisition mode. (See page 29, *Peak Detect.*) This mode samples the highest and lowest values so that the oscilloscope can detect faster signals. If the shape of the waveform changes drastically, you may have aliasing.

- If the trigger frequency is faster than the display information, you may have aliasing or a waveform that crosses the trigger level multiple times. Examining the waveform allows you to identify whether the shape of the signal is going to allow a single trigger crossing per cycle at the selected trigger level.

  If multiple triggers are likely to occur, select a trigger level that will generate only a single trigger per cycle. If the trigger frequency is still faster than the display indicates, you may have aliasing.

  If the trigger frequency is slower, this test is not useful.

- If the signal you are viewing is also the trigger source, use the graticule or the cursors to estimate the frequency of the displayed waveform. Compare this to the Trigger Frequency readout in the lower right corner of the screen. If they differ by a large amount, you may have aliasing.

The next table lists the time base settings that you can use to avoid aliasing at various frequencies and the respective sample rate. At the fastest SEC/DIV setting, aliasing is not likely to occur due to the bandwidth limitations of the oscilloscope input amplifiers.
### Settings to avoid aliasing in Sample mode

† Bandwidth reduced to 6 MHz with a P2220 probe set to 1X.
Understanding Oscilloscope Functions

Taking Measurements

The oscilloscope displays graphs of voltage versus time and can help you to measure the displayed waveform.

There are several ways to take measurements. You can use the graticule, the cursors, or an automated measurement.

Graticule

This method allows you to make a quick, visual estimate. For example, you might look at a waveform amplitude and determine that it is a little more than 100 mV.

You can take simple measurements by counting the major and minor graticule divisions involved and multiplying by the scale factor.

For example, if you counted five major vertical graticule divisions between the minimum and maximum values of a waveform and knew you had a scale factor of 100 mV/division, then you could calculate your peak-to-peak voltage as follows:

\[ 5 \text{ divisions} \times 100 \text{ mV/division} = 500 \text{ mV} \]

Cursor

![Cursor Diagram]

Cursor

This method allows you to take measurements by moving the cursors, which always appear in pairs, and reading their numeric values from the display readouts. There are two types of cursors: Amplitude and Time.

When you use cursors, be sure to set the Source to the waveform on the display that you want to measure.
To use cursors, push the CURSOR button.

**Amplitude Cursors.** Amplitude cursors appear as horizontal lines on the display and measure the vertical parameters. Amplitudes are referenced to the reference level. For the Math FFT function, these cursors measure magnitude.

**Time Cursors.** Time cursors appear as vertical lines on the display and measure both horizontal and vertical parameters. Times are referenced to the trigger point. For the Math FFT function, these cursors measure frequency.

Time cursors also include a readout of the waveform amplitude at the point the waveform crosses the cursor.

**Automatic**

The MEASURE Menu can take up to five automatic measurements. When you take automatic measurements, the oscilloscope does all the calculating for you. Because the measurements use the waveform record points, they are more accurate than the graticule or cursor measurements.

Automatic measurements use readouts to show measurement results. These readouts are updated periodically as the oscilloscope acquires new data.

For measurement descriptions, refer to the *Reference* chapter. (See page 111, *Taking Measurements.*)
Application Examples

This section presents a series of application examples. These simplified examples highlight the features of the oscilloscope and give you ideas for using it to solve your own test problems.

- Taking simple measurements
  - Using Autoset
  - Using the Measure Menu to take automatic measurements
  - Measuring two signals and calculating gain
- Using Autorange to examine a series of test points
- Taking cursor measurements
  - Measuring ring frequency and ring amplitude
  - Measuring pulse width
  - Measuring rise time
- Analyzing signal detail
  - Looking at a noisy signal
  - Using the average function to separate a signal from noise
- Capturing a single-shot signal
  - Optimizing the acquisition
- Measuring propagation delay
- Triggering on a pulse width
- Triggering on a video signal
  - Triggering on video fields and video lines
  - Using the window function to see waveform details
- Analyzing a differential communication signal using Math functions
- Viewing impedance changes in a network using XY mode and persistence
Taking Simple Measurements

You need to see a signal in a circuit, but you do not know the amplitude or frequency of the signal. You want to quickly display the signal and measure the frequency, period, and peak-to-peak amplitude.

Using Autoset

To quickly display a signal, follow these steps:

1. Push the CH 1 MENU button.
2. Push Probe ► Voltage ► Attenuation ► 10X.
3. Set the switch to 10X on the P2220 probe.
4. Connect the channel 1 probe tip to the signal. Connect the reference lead to the circuit reference point.
5. Push the AUTOSET button.

The oscilloscope sets the vertical, horizontal, and trigger controls automatically. If you want to optimize the display of the waveform, you can manually adjust these controls.

**NOTE.** The oscilloscope displays relevant automatic measurements in the waveform area of the screen based on the signal type that is detected.
For oscilloscope-specific descriptions, refer to the Reference chapter. (See page 98, Autoset.)

**Taking Automatic Measurements**

The oscilloscope can take automatic measurements of most displayed signals.

---

**NOTE.** If a question mark (?) appears in the Value readout, the signal is outside the measurement range. Adjust the VOLTS/DIV knob of the appropriate channel to decrease the sensitivity or change the SEC/DIV setting.

---

To measure signal frequency, period, and peak-to-peak amplitude, rise time, and positive width, follow these steps:

1. Push the **MEASURE** button to see the Measure Menu.
2. Push the top option button; the Measure 1 Menu appears.
3. Push **Type ➤ Freq.**
   
   The **Value** readout displays the measurement and updates.
4. Push the **Back** option button.
5. Push the second option button from the top; the Measure 2 Menu appears.
6. Push **Type ➤ Period.**
   
   The **Value** readout displays the measurement and updates.
7. Push the **Back** option button.
8. Push the middle option button; the Measure 3 Menu appears.
9. Push **Type ► Pk-Pk**.

The **Value** readout displays the measurement and updates.

10. Push the **Back** option button.

11. Push the second option button from the bottom; the Measure 4 Menu appears.

12. Push **Type ► Rise Time**.

The **Value** readout displays the measurement and updates.

13. Push the **Back** option button.

14. Push the bottom option button; the Measure 5 Menu appears.

15. Push **Type ► Pos Width**.

The **Value** readout displays the measurement and updates.

16. Push the **Back** option button.
Measuring Two Signals

If you are testing a piece of equipment and need to measure the gain of the audio amplifier, you will need an audio generator that can inject a test signal at the amplifier input. Connect two oscilloscope channels to the amplifier input and output as shown next. Measure both signal levels and use the measurements to calculate the gain.

![Diagram showing the connection of the oscilloscope channels to the amplifier.]

<table>
<thead>
<tr>
<th>CH1 Pk-Pk</th>

</tr>
<tr>
<td>CH1 None</td>
<td></td>
</tr>
<tr>
<td>CH1 None</td>
<td></td>
</tr>
<tr>
<td>CH1 None</td>
<td></td>
</tr>
</tbody>
</table>
To activate and display the signals connected to channel 1 and to channel 2, and select measurements for the two channels, follow these steps:

1. Push the **AUTOSET** button.
2. Push the **MEASURE** button to see the Measure Menu.
3. Push the top option button; the Measure 1 Menu appears.
4. Push **Source ► CH1**.
5. Push **Type ► Pk-Pk**.
6. Push the **Back** option button.
7. Push the second option button from the top; the Measure 2 Menu appears.
8. Push **Source ► CH2**.
9. Push **Type ► Pk-Pk**.
10. Push the **Back** option button.

Read the displayed peak-to-peak amplitudes for both channels.

11. To calculate the amplifier voltage gain, use these equations:

\[
\text{VoltageGain} = \frac{\text{output amplitude}}{\text{input amplitude}}
\]

\[
\text{VoltageGain (dB)} = 20 \times \log_{10}(\text{VoltageGain})
\]
Using Autorange to Examine a Series of Test Points

If you have a machine that is malfunctioning, you may need to find the frequency and RMS voltage of several test points, and compare these values to ideal values. You are not able to access front-panel controls since you need to use both hands when probing test points that are difficult to physically reach.

1. Push the CH 1 MENU button.
2. Push Probe ► Voltage ► Attenuation and set to match the attenuation of the probe attached to channel 1.
3. Push the AUTORANGE button to activate autoranging, and select the Vertical and Horizontal option.
4. Push the MEASURE button to see the Measure Menu.
5. Push the top option button; the Measure 1 Menu appears.
7. Push Type ► Frequency.
8. Push the Back option button.
9. Push the second option button from the top; the Measure 2 Menu appears.
11. Push Type ► Cyc RMS.
12. Push the Back option button.
13. Attach the probe tip and reference lead to the first test point. Read the frequency and cycle RMS measurements from the oscilloscope display and compare these to the ideal values.
14. Repeat step 13 for each test point, until you find the malfunctioning component.

**NOTE.** When Autorange is active, each time you move the probe to another test point, the oscilloscope readjusts the horizontal scale, the vertical scale, and the trigger level, to give you a useful display.
Taking Cursor Measurements

You can use the cursors to quickly take time and amplitude measurements on a waveform.

Measuring Ring Frequency and Amplitude

To measure the ring frequency at the rising edge of a signal, follow these steps:

1. Push the CURSOR button to see the Cursor Menu.
2. Push Type ► Time.
4. Push the Cursor 1 option button.
5. Turn the multipurpose knob to place a cursor on the first peak of the ring.
6. Push the Cursor 2 option button.
7. Turn the multipurpose knob to place a cursor on the second peak of the ring.

You can see the Δ (delta) time and frequency (the measured ring frequency) in the Cursor Menu.

![Graph showing cursor measurements](image-url)
8. Push Type ► Amplitude.

9. Push the Cursor 1 option button.

10. Turn the multipurpose knob to place a cursor on the first peak of the ring.

11. Push the Cursor 2 option button.

12. Turn the multipurpose knob to place Cursor 2 on the lowest part of the ring.

You can see the amplitude of the ring in the Cursor Menu.

Measuring Pulse Width

If you are analyzing a pulse waveform and you want to know the width of the pulse, follow these steps:

1. Push the CURSOR button to see the Cursor Menu.

2. Push Type ► Time.

4. Push the Cursor 1 option button.

5. Turn the multipurpose knob to place a cursor on the rising edge of the pulse.

6. Push the Cursor 2 option button.

7. Turn the multipurpose knob to place a cursor on the falling edge of the pulse.
You can see the following measurements in the Cursor Menu:

- The time at Cursor 1, relative to the trigger.
- The time at Cursor 2, relative to the trigger.
- The $\Delta$ (delta) time, which is the pulse width measurement.

NOTE. The Positive Width measurement is available as an automatic measurement in the Measure Menu. (See page 111, Taking Measurements.)

NOTE. The Positive Width measurement also displays when you select the Single-Cycle Square option in the AUTOSET Menu. (See page 101, Square Wave or Pulse.)
Measuring Rise Time

After measuring the pulse width, you decide that you need to check the rise time of the pulse. Typically, you measure rise time between the 10% and 90% levels of the waveform. To measure the rise time, follow these steps:

1. Turn the SEC/DIV knob to display the rising edge of the waveform.
2. Turn the VOLTS/DIV and VERTICAL POSITION knobs to set the waveform amplitude to about five divisions.
3. Push the CH 1 MENU button.
5. Turn the VOLTS/DIV knob to set the waveform amplitude to exactly five divisions.
6. Turn the VERTICAL POSITION knob to center the waveform; position the baseline of the waveform 2.5 divisions below the center graticule.
7. Push the CURSOR button to see the Cursor Menu.
8. Push Type ► Time.
10. Push the Cursor 1 option button.
11. Turn the multipurpose knob to place a cursor at the point where the waveform crosses the second graticule line below center screen. This is the 10% level of the waveform.
12. Push the Cursor 2 option button.
13. Turn the multipurpose knob to place a cursor at the point where the waveform crosses the second graticule line above center screen. This is the 90% level of the waveform.

The Δt readout in the Cursor Menu is the rise time of the waveform.
### Application Examples

#### 5 divisions

<table>
<thead>
<tr>
<th>Type</th>
<th>Time</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>CH1</td>
<td>Δ$t$ 140.0ns</td>
<td>1/Δ$t$ 7.143MHz</td>
</tr>
<tr>
<td></td>
<td>Δ$V$ 2.08V</td>
<td></td>
</tr>
</tbody>
</table>

**Cursor 1**
- 80.0ns
- 1.02V

**Cursor 2**
- 60.0ns
- 1.06V

**NOTE.** The Rise Time measurement is available as an automatic measurement in the Measure Menu. (See page 111, Taking Measurements.)

**NOTE.** The Rise Time measurement also displays when you select the Rising Edge option in the AUTOSET Menu. (See page 101, Square Wave or Pulse.)

### Analyzing Signal Detail

You have a noisy signal displayed on the oscilloscope and you need to know more about it. You suspect that the signal contains much more detail than you can now see in the display.
Looking at a Noisy Signal

The signal appears noisy and you suspect that noise is causing problems in your circuit. To better analyze the noise, follow these steps:

1. Push the **ACQUIRE** button to see the Acquire Menu.
2. Push the **Peak Detect** option button.
3. If necessary, push the **DISPLAY** button to see the Display Menu. Use the **Adjust Contrast** option button with the multipurpose knob to adjust the display to see the noise more easily.

Peak detect emphasizes noise spikes and glitches in your signal, especially when the time base is set to a slow setting.
Separating the Signal from Noise

Now you want to analyze the signal shape and ignore the noise. To reduce random noise in the oscilloscope display, follow these steps:

1. Push the **ACQUIRE** button to see the Acquire Menu.

2. Push the **Average** option button.

3. Push the **Averages** option button to see the effects of varying the number of running averages on the waveform display.

Averaging reduces random noise and makes it easier to see detail in a signal. In the example below, a ring shows on the rising and falling edges of the signal when the noise is removed.
Capturing a Single-Shot Signal

The reliability of a reed relay in a piece of equipment has been poor and you need to investigate the problem. You suspect that the relay contacts arc when the relay opens. The fastest that you can open and close the relay is about once per minute, so you need to capture the voltage across the relay as a single-shot acquisition.

To set up for a single-shot acquisition, follow these steps:

1. Turn the vertical VOLTS/DIV and horizontal SEC/DIV knobs to the appropriate ranges for the signal you expect to see.
2. Push the ACQUIRE button to see the Acquire Menu.
3. Push the Peak Detect option button.
4. Push the TRIG MENU button to see the Trigger Menu.
5. Push Slope ► Rising.
6. Turn the LEVEL knob to adjust the trigger level to a voltage midway between the open and closed voltages of the relay.
7. Push the SINGLE SEQ button to start the acquisition.

When the relay opens, the oscilloscope triggers and captures the event.
Optimizing the Acquisition

The initial acquisition shows the relay contact beginning to open at the trigger point. This is followed by a large spike that indicates contact bounce and inductance in the circuit. The inductance can cause contact arcing and premature relay failure.

You can use the vertical, horizontal, and trigger controls to optimize the settings before the next single-shot event is captured. When the next acquisition is captured with the new settings (push the SINGLE SEQ button again), you can see that the contact bounces several times as it opens.
Measuring Propagation Delay

You suspect that the memory timing in a microprocessor circuit is marginal. Set up the oscilloscope to measure the propagation delay between the chip-select signal and the data output of the memory device.
To set up to measure propagation delay, follow these steps:

1. Push the **AUTOSET** button to trigger a stable display.
2. Adjust the horizontal and vertical controls to optimize the display.
3. Push the **CURSOR** button to see the Cursor Menu.
4. Push **Type ► Time**.
5. Push **Source ► CH1**.
6. Push the **Cursor 1** option button.
7. Turn the multipurpose knob to place a cursor on the active edge of the chip-select signal.
8. Push the **Cursor 2** option button.
9. Turn the multipurpose knob to place the second cursor on the data output transition.

The $\Delta t$ readout in the Cursor Menu is the propagation delay between the waveforms. The readout is valid because the two waveforms have the same SEC/DIV setting.

**Triggering on a Specific Pulse Width**

You are testing the pulse widths of a signal in a circuit. It is critical that the pulses all be a specific width, and you need to verify that they are. Edge triggering shows that your signal is as specified, and the pulse width measurement does not vary from the specification. However, you think there might be a problem.
To set up a test for pulse width aberrations, follow these steps:

1. Push the **AUTOSET** button to trigger a stable display.

2. Push the **Single Cycle** option button in the AUTOSET Menu to view a single cycle of the signal, and to quickly take a Pulse Width measurement.

3. Push the **TRIG MENU** button to see the Trigger Menu.

4. Push **Type ▶ Pulse**.

5. Push **Source ▶ CH1**.

6. Turn the **TRIGGER LEVEL** knob to set the trigger level near the bottom of the signal.

7. Push **When ▶ =** (equals).

8. Turn the multipurpose knob to set the pulse width to the value reported by the Pulse Width measurement in step 2.

9. Push **More ▶ Mode ▶ Normal**.

You can achieve a stable display with the oscilloscope triggering on normal pulses.

1. Push the **When** option button to select ≠, <, or >. If there are any aberrant pulses that meet the specified When condition, the oscilloscope triggers.
NOTE. The trigger frequency readout shows the frequency of events that the oscilloscope might consider to be a trigger, and may be less than the frequency of the input signal in Pulse Width trigger mode.

Triggering on a Video Signal

You are testing the video circuit in a piece of medical equipment and need to display the video output signal. The video output is an NTSC standard signal. Use the video trigger to obtain a stable display.
NOTE. Most video systems use 75 ohm cabling. The oscilloscope inputs do not properly terminate low impedance cabling. To avoid amplitude inaccuracy from improper loading and reflections, place a 75 ohm feedthrough terminator (Tektronix part number 011-0055-02 or equivalent) between the 75 ohm coaxial cable from the signal source and the oscilloscope BNC input.

Triggering on Video Fields

Automatic. To trigger on the video fields, follow these steps:

1. Push the AUTOSET button. When Autoset is complete, the oscilloscope displays the video signal with sync on All Fields.
The oscilloscope sets the Standard option when you use the Autoset function.

1. Push the **Odd Field** or **Even Field** option buttons from the AUTOSET Menu to sync on odd or even fields only.

**Manual.** An alternative method requires more steps, but may be necessary depending on the video signal. To use the manual method, follow these steps:

1. Push the **CH 1 MENU** button.
2. Push **Coupling ► AC**.
3. Push the **TRIG MENU** button to see the Trigger Menu.
4. Push the top option button and select **Video**.
5. Push **Source ► CH1**.
6. Push the **Sync** option button and select **All Fields, Odd Field, or Even Field**.
7. Push **Standard ► NTSC**.
8. Turn the horizontal **SEC/DIV** knob to see a complete field across the screen.
9. Turn the vertical **VOLTS/DIV** knob to ensure that the entire video signal is visible on the screen.
Triggering on Video Lines

**Automatic.** You can also look at the video lines in the field. To trigger on the video lines, follow these steps:

1. Push the AUTOSET button.
2. Push the top option button to select Line to sync on all lines. (The AUTOSET Menu includes All Lines and Line Number options.)

**Manual.** An alternative method requires more steps, but may be necessary depending on the video signal. To use this method, follow these steps:

1. Push the TRIG MENU button to see the Trigger Menu.
2. Push the top option button and select Video.
3. Push the Sync option button and select All Lines or Line Number and turn the multipurpose knob to set a specific line number.
4. Push Standard ➤ NTSC.
5. Turn the SEC/DIV knob to see a complete video line across the screen.
6. Turn the VOLTS/DIV knob to ensure that the entire video signal is visible on the screen.
Using the Window Function to See Waveform Details

You can use the window (zoom) function to examine a specific portion of a waveform without changing the main display.

If you want to view the color burst in the previous waveform in more detail without changing the main display, follow these steps:

1. Push the HORIZ MENU button to see the Horizontal Menu and select the Main option.
2. Push the Window Zone option button.
3. Turn the SEC/DIV knob and select 500 ns. This will be the SEC/DIV setting of the expanded view.
4. Turn the HORIZONTAL POSITION knob to position the window around the portion of the waveform that you want to expand.
1. Push the **Window** option button to see the expanded portion of the waveform.

2. Turn the **SEC/DIV** knob to optimize viewing the expanded waveform.

To switch between the Main and Window views, push the **Main** or **Window** option button in the Horizontal Menu.

---

**Analyzing a Differential Communication Signal**

You are having intermittent problems with a serial data communication link, and you suspect poor signal quality. Set up the oscilloscope to show you a snapshot of the serial data stream so you can verify the signal levels and transition times.

Because this is a differential signal, you use the Math function of the oscilloscope to view a better representation of the waveform.
NOTE. Be sure to first compensate both probes. Differences in probe compensation appear as errors in the differential signal.
To activate the differential signals connected to channel 1 and to channel 2, follow these steps:

1. Push the CH 1 MENU button and set the Probe ► Voltage ► Attenuation option to 10X.

2. Push the CH 2 MENU button and set the Probe ► Voltage ► Attenuation option to 10X.

3. Set the switches to 10X on the P2220 probes.

4. Push the AUTOSET button.

5. Push the MATH MENU button to see the Math Menu.

6. Push the Operation option button and select -.

7. Push the CH1-CH2 option button to display a new waveform that is the difference between the displayed waveforms.

8. To adjust the vertical scale and position of the Math waveform, follow these steps:

   a. Remove the channel 1 and channel 2 waveforms from the display.

   b. Turn the CH 1 and CH 2 VOLTS/DIV and the VERTICAL POSITION knobs to adjust the vertical scale and position of the Math waveform.

For a more stable display, push the SINGLE SEQ button to control the acquisition of the waveform. Each time you push the SINGLE SEQ button, the oscilloscope acquires a snapshot of the digital data stream. You can use the cursors or automatic measurements to analyze the waveform, or you can store the waveform to analyze later.

### Viewing Impedance Changes in a Network

You have designed a circuit that needs to operate over a wide temperature range. You need to evaluate the change in impedance of the circuit as the ambient temperature is changed.

Connect the oscilloscope to monitor the input and output of the circuit and capture the changes that occur as you vary the temperature.
To view the input and output of the circuit in an XY display, follow these steps:

1. Push the CH 1 MENU button.
2. Push Probe ► Voltage ► Attenuation ► 10X.
3. Push the CH 2 MENU button.
4. Push Probe ► Voltage ► Attenuation ► 10X.
5. Set the switches to 10X on the P2220 probes.
6. Connect the channel 1 probe to the input of the network, and connect the channel 2 probe to the output.
7. Push the AUTOSET button.

8. Turn the VOLTS/DIV knobs to display approximately the same amplitude signals on each channel.

9. Push the DISPLAY button to see the Display Menu.

10. Push Format ► XY.

   The oscilloscope displays a Lissajous pattern representing the input and output characteristics of the circuit.

11. Turn the VOLTS/DIV and VERTICAL POSITION knobs to optimize the display.

13. Push the Adjust Contrast option button and turn the multipurpose knob to adjust the display.

   As you adjust the ambient temperature, the display persistence captures the changes in the characteristics of the circuit.
Math FFT

This chapter contains detailed information on how to use the Math FFT (Fast Fourier Transform). You can use the FFT Math mode to convert a time-domain (YT) signal into its frequency components (spectrum). You can use the Math FFT mode for the following types of analysis:

- Analyze harmonics in power lines
- Measure harmonic content and distortion in systems
- Characterize noise in DC power supplies
- Test impulse response of filters and systems
- Analyze vibration

To use the Math FFT mode, you need to perform the following tasks:

- Set up the source (time-domain) waveform
- Display the FFT spectrum
- Select a type of FFT window
- Adjust the sample rate to display the fundamental frequency and harmonics without aliasing
- Use zoom controls to magnify the spectrum
- Use cursors to measure the spectrum

Setting Up the Time-Domain Waveform

Before you use FFT mode, you need to set up the time-domain (YT) waveform. To do so, follow these steps:

1. Push AUTOSET to display a YT waveform.
2. Turn the VERTICAL POSITION knob to move the YT waveform to the center vertically (zero divisions).
This ensures that the FFT will show a true DC value.

3. Turn the **HORIZONTAL POSITION** knob to position the part of the YT waveform that you want to analyze in the center eight divisions of the screen.

   The oscilloscope calculates the FFT spectrum using the center 2048 points of the time-domain waveform.

4. Turn the **VOLTS/DIV** knob to ensure that the entire waveform remains on the screen. The oscilloscope may display erroneous FFT results (by adding high frequency components) if the entire waveform is not visible.

5. Turn the **SEC/DIV** knob to provide the resolution you want in the FFT spectrum.

6. If possible, set the oscilloscope to display many signal cycles.

   If you turn the **SEC/DIV** knob to select a faster setting (fewer cycles), the FFT spectrum shows a larger frequency range, and reduces the possibility of FFT aliasing. (See page 73, *FFT Aliasing*.) However, the oscilloscope also displays less frequency resolution.

To set up the FFT display, follow these steps:

1. Push the **MATH MENU** button to see the Math Menu.
2. Push **Operation ► FFT**.
3. Select the **Math FFT Source** channel.

   In many cases, the oscilloscope can produce a useful FFT spectrum even if the YT waveform is not triggered. This is especially true if your signal is periodic or random (noisy).

   **NOTE.** Trigger and position any transient or burst waveforms as closely as possible to the center of the screen.

---

**Nyquist Frequency**

The highest frequency that any real-time digitizing oscilloscope can measure without errors is one-half the sample rate. This frequency is called the Nyquist frequency. Frequency information above the Nyquist
frequency is undersampled, which causes FFT aliasing. (See page 73, *FFT Aliasing*.)

The math function transforms the center 2048 points of the time-domain waveform into an FFT spectrum. The resulting FFT spectrum contains 1024 points that go from DC (0 Hz) to the Nyquist frequency.

Normally, the display compresses the FFT spectrum horizontally into 250 points, but you can use the FFT Zoom function to expand the FFT spectrum to more clearly see the frequency components at each of the 1024 data points in the FFT spectrum.

**NOTE.** The oscilloscope vertical response rolls off slowly above its bandwidth (40 MHz, 60 MHz, 100 MHz or 200 MHz, depending on the model, or 20 MHz when the Bandwidth Limit option is ON). Therefore, the FFT spectrum can show valid frequency information higher than the oscilloscope bandwidth. However, the magnitude information near or above the bandwidth will not be accurate.

### Displaying the FFT Spectrum

Push the **MATH MENU** button to display the Math Menu. Use the options to select the Source channel, Window algorithm, and FFT Zoom factor. You can display only one FFT spectrum at a time.

<table>
<thead>
<tr>
<th>Math FFT option</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>CH1, CH2, CH3 1, CH4 1</td>
<td>Selects the channel used as the FFT source</td>
</tr>
<tr>
<td>Window</td>
<td>Hanning, Flattop, Rectangular</td>
<td>Selects the FFT window type; (See page 70, <em>Selecting an FFT Window.</em>)</td>
</tr>
<tr>
<td>FFT Zoom</td>
<td>X1, X2, X5, X10</td>
<td>Changes the horizontal magnification of the FFT display; (See page 74, <em>Magnifying and Positioning an FFT Spectrum.</em>)</td>
</tr>
</tbody>
</table>

1 Available only on a 4-channel oscilloscope.
1. Frequency at the center graticule line.
2. Vertical scale in dB per division (0 dB = 1 \( V_{RMS} \)).
3. Horizontal scale in frequency per division.
4. Sample rate in number of samples per second.
5. FFT window type.

**Selecting an FFT Window**

Windows reduce spectral leakage in the FFT spectrum. The FFT assumes that the YT waveform repeats forever. With an integral number of cycles (1, 2, 3, ...), the YT waveform starts and ends at the same amplitude and there are no discontinuities in the signal shape.

A non-integral number of cycles in the YT waveform causes the signal start and end points to be at different amplitudes. The transitions between the start and end points cause discontinuities in the signal that introduce high-frequency transients.
Applying a window to the YT waveform changes the waveform so that the start and stop values are close to each other, reducing the discontinuities.
The Math FFT function includes three FFT Window options. There is a trade-off between frequency resolution and amplitude accuracy with each type of window. What you want to measure and your source signal characteristics will help you to determine which window to use.

<table>
<thead>
<tr>
<th>Window</th>
<th>Measure</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hanning</td>
<td>Periodic waveforms</td>
<td>Better frequency, poorer magnitude accuracy than Flattop</td>
</tr>
<tr>
<td>Flattop</td>
<td>Periodic waveforms</td>
<td>Better magnitude, poorer frequency accuracy than Hanning</td>
</tr>
<tr>
<td>Rectangular</td>
<td>Pulses or transients</td>
<td>Special-purpose window for waveforms that do not have discontinuities. This is essentially the same as no window</td>
</tr>
</tbody>
</table>
FFT Aliasing

Problems occur when the oscilloscope acquires a time-domain waveform containing frequency components that are greater than the Nyquist frequency. (See page 68, *Nyquist Frequency.*) The frequency components that are above the Nyquist frequency are undersampled, appearing as lower frequency components that "fold back" around the Nyquist frequency. These incorrect components are called aliases.

![Diagram of FFT Aliasing](image-url)
Eliminating Aliases

To eliminate aliases, try the following remedies:

- Turn the SEC/DIV knob to set the sample rate to a faster setting. Since you increase the Nyquist frequency as you increase the sample rate, the aliased frequency components appear at their proper frequency. If too many frequency components are shown on the screen, you can use the FFT Zoom option to magnify the FFT spectrum.

- If you do not need to view frequency components above 20 MHz, set the Bandwidth Limit option to On.

- Put an external filter on the source signal to bandwidth limit the source waveform to frequencies below that of the Nyquist frequency.

- Recognize and ignore the aliased frequencies.

- Use zoom controls and the cursors to magnify and measure the FFT spectrum.

Magnifying and Positioning an FFT Spectrum

You can magnify and use cursors to take measurements on the FFT spectrum. The oscilloscope includes an FFT Zoom option to magnify horizontally. To magnify vertically, you can use the vertical controls.

Horizontal Zoom and Position

The FFT Zoom option lets you horizontally magnify the FFT spectrum without changing the sample rate. Zoom factors are X1 (default), X2, X5, and X10. At zoom factor X1, and with the waveform centered in the graticule, the left graticule line is at 0 Hz and the right graticule line is at the Nyquist frequency.

When you change the zoom factor, the FFT spectrum is magnified about the center graticule line. In other words, the axis of horizontal magnification is the center graticule line.

Turn the HORIZONTAL POSITION knob clockwise to move the FFT spectrum to the right. Push the SET TO ZERO button to position the center of the spectrum at the center of the graticule.
Vertical Zoom and Position

The channel vertical knobs become vertical zoom and position controls for their respective channels when displaying the FFT spectrum. The VOLTS/DIV knob provides zoom factors of X0.5, X1 (default), X2, X5, and X10. The FFT spectrum is vertically magnified about the M marker (math waveform reference point on the left edge of the screen).

Turn the VERTICAL POSITION knob clockwise to move the spectrum up for the source channel.

Measuring an FFT Spectrum Using Cursors

You can take two measurements on FFT spectrums: magnitude (in dB), and frequency (in Hz). Magnitude is referenced to 0 dB, where 0 dB equals 1 \( V_{RMS} \).

You can use the cursors to take measurements at any zoom factor. To do so, follow these steps:

1. Push the CURSOR button to see the Cursor Menu.
2. Push Source ➤ MATH.
3. Push the Type option button to select Magnitude or Frequency.
4. Use the multipurpose knob to move cursors 1 and 2.

Use horizontal cursors to measure magnitude and vertical cursors to measure frequency. The options display the delta between the two cursors, the value at cursor 1 position, and the value at cursor 2 position. Delta is the absolute value of cursor 1 minus cursor 2.
You can also take a frequency measurement without using the cursors. To do so, turn the Horizontal Position knob to position a frequency component on the center graticule line and read the frequency at the top right of the display.
USB Flash Drive and Device Ports

This chapter describes how to use the Universal Serial Bus (USB) ports on the oscilloscope to do the following tasks:

- Save and recall waveform data or setup data, or save a screen image
- Print a screen image
- Transfer waveform data, setup data, or a screen image to a PC
- Control the oscilloscope with remote commands

To use the PC Communications software, launch and refer to the online help from the software.

USB Flash Drive Port

The front of the oscilloscope has a USB Flash Drive port to accommodate a USB flash drive for file storage. The oscilloscope can save data to and retrieve data from the flash drive.

NOTE. The oscilloscope can only support flash drives with a storage capacity of 2 GB or less.

To connect a USB flash drive, follow these steps:

1. Align the USB flash drive with the USB Flash Drive port on the oscilloscope. Flash drives are shaped for proper installation.
2. Insert the flash drive into the port until the drive is fully inserted.
For flash drives with an LED, the drive "blinks" while the oscilloscope writes data to or reads data from the drive. The oscilloscope also displays a clock symbol to indicate when the flash drive is active.

After a file is saved or retrieved, the LED on the drive (if any) stops blinking, and the oscilloscope removes the clock. A hint line also displays to notify you that the save or recall operation is complete.

To remove a USB flash drive, wait until the LED on the drive (if any) stops blinking or until the hint line appears that says the operation is complete, grab the edge of the drive, and extract the drive from the port.

**Flash Drive Initial Read Time**

The oscilloscope reads the internal structure of a USB flash drive each time you install a drive. The time to complete the read depends on the size of the flash drive, how the drive is formatted, and the number of files stored on the drive.

*NOTE.* To significantly shorten the initial read time of 64 MB and larger USB flash drives, format the drive on your PC.

**Formatting a Flash Drive**

The Format function deletes all data on the USB flash drive. To format a flash drive, follow these steps:

1. Insert a USB flash drive into the Flash Drive port on the front of the oscilloscope.
2. Push the **UTILITY** button to see the Utility Menu.
3. Push **File Utilities ▶ More ▶ Format**.
4. Select **Yes** to format the flash drive.
Flash Drive Capacities

The oscilloscope can store the following types and number of files per 1 MB of USB flash drive memory:

- 5 Save All operations; (See page 82, Saves All to Files.) (See page 115, Save All.)
- 16 screen image files (capacity depends on the image format); (See page 84, Saves Image to File.) (See page 115, Save Image.)
- 250 oscilloscope setting (.SET) files; (See page 116, Save Setup.)
- 18 waveform (.CSV) files; (See page 117, Save Waveform.)

File Management Conventions

The oscilloscope uses the following file management conventions for data storage:

- The oscilloscope checks for available space on the USB flash drive before writing files, and displays a warning message if there is not enough memory available.
- The term “folder” refers to a directory location on the USB flash drive.
- The default location for the file save or file recall functions is the current folder.
- A:\ is the root folder.
- The oscilloscope resets the current folder to A:\ when you power on the oscilloscope, or when you insert a USB flash drive after the oscilloscope is powered on.
- File names can have one to eight characters, followed by a period, and then followed with an extension of one to three characters.
- The oscilloscope displays long file names created on PC operating systems with the shortened file name from the operating system.
- File names are case insensitive and are displayed in upper case.
You can use the File Utilities menu to do the following tasks:

- List the contents of the current folder
- Select a file or folder
- Navigate to other folders
- Create, rename, and delete files and folders
- Format the USB flash drive

(See page 131, *File Utilities for the USB Flash Drive.*)

**Saving and Recalling Files With a USB Flash Drive**

There are two ways to operate the USB flash drive for file storage:

- through the Save/Recall menu
- through the alternative Save function of the Print button

You can use the following Save/Recall menu options to write data to or retrieve data from a USB flash drive:

- Save Image
- Save Setup
- Save Waveform
- Recall Setup
- Recall Waveform

**NOTE.** The PRINT button can be used as a SAVE button for quick storage of files to a flash drive. For information on how to save many files at once, or images one after another, refer to Using the Save Functions of the Print Button. (See page 82, Using the Save Function of the PRINT Front Panel Button.)

**Save Image, Save Setup, and Save Waveform Options**

You can save a screen image, the oscilloscope settings, or waveform data to a file on the USB flash drive through the Save/Recall menu.
Each save option operates in a similar way. As an example, to save a screen image file to a flash drive, follow these steps:

1. Insert a USB flash drive into the USB Flash Drive port.

2. Push **UTILITY ► Options ► Printer Setup** and set the following options:

<table>
<thead>
<tr>
<th>Ink Saver</th>
<th>On, Off</th>
<th>Prints the screen image on a white background when you select On</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layout</td>
<td>Portrait, Landscape</td>
<td>Printer output orientation</td>
</tr>
</tbody>
</table>

3. Access the screen you want to save.

4. Push the **SAVE/RECALL** front panel button.

5. Select the **Action ► Save Image ► Save** option.

   The oscilloscope saves the screen image in the current folder and automatically generates the file name. (See page 114, *Save/Recall.*)

### Recall Setup, and Recall Waveform Options

You can recall the oscilloscope settings or waveform data from a file on the USB flash drive through the Save/Recall menu.

Each recall option operates in a similar way. As an example, to recall a waveform file from a USB flash drive, follow these steps:

1. Insert the USB flash drive that contains the desired waveform file into the USB Flash Drive port on the front of the oscilloscope.

2. Push the **SAVE/RECALL** front panel button.

3. Select the **Action ► Recall Waveform ► Select File** option.

   You can use the Change Folder option to navigate to another folder on the flash drive.

4. Turn the multipurpose knob to select the waveform file to recall.

   The name of the file in the Recall option changes as you scroll.
5. Select the To option and specify which reference memory location to recall the waveform to RefA or RefB. RefC and RefD are available on 4-channel models.

6. Push the Recall FnnnnCHx.CSV option button, where FnnnnCHx.CSV is the name of the waveform file.

**NOTE.** For folders on the flash drive that contain one waveform file, select the SAVE/RECALL ► Action ► Recall Waveform ► To option and specify the reference memory location to recall the waveform to. The name of the file appears in the Recall option.(See page 114, Save/Recall.)

### Using the Save Function of the PRINT Front Panel Button

You can set the PRINT front panel button to write data to the USB flash drive as an alternative function. To set the function of the PRINT button to save data, access one of the following options:

- **SAVE/RECALL ► Save All ► PRINT Button**
- **UTILITY ► Options ► Printer Setup**

**NOTE.** An LED by the PRINT button lights to indicate the alternative SAVE function that writes data to the USB flash drive.

### Saves All to Files

The Saves All to Files option lets you save the current oscilloscope information to files on the USB flash drive. A single Saves All to Files action uses less than 700 kB of space on the flash drive.

Before you can save data to the USB flash drive, you need to change the PRINT front panel button to the alternative SAVE function. To do so, select the **SAVE/RECALL ► Save All ► PRINT Button ► Saves All to Files** option.

To save all the oscilloscope files to a USB flash drive, follow these steps:

1. Insert a USB flash drive into the USB Flash Drive port.
2. To change the folder designated as the current folder, push the **Select Folder** option button.
The oscilloscope creates a new folder within the current folder each time you push the PRINT front panel button, and automatically generates the folder name.

3. Set up the oscilloscope to capture your data.

4. Push the PRINT (SAVE) button.

The oscilloscope creates a new folder on the flash drive and saves the screen image, waveform data, and setup data in separate files in that new folder, using the current oscilloscope and file format settings. The oscilloscope names the folder ALLnnnn. (See page 114, Save/Recall.)

To see a list of the files created by the Saves All To Files function, access the UTILITY ► File Utilities menu.

<table>
<thead>
<tr>
<th>Source</th>
<th>File name</th>
</tr>
</thead>
<tbody>
<tr>
<td>CH(x)</td>
<td>FnnnnCHx.CSV, where nnn is an automatically-generated number, and x is the channel number</td>

</tbody>
</table>

Before you can save data to the USB flash drive, you must change the PRINT button to the alternative SAVE function. To do so, select the SAVE/RECALL ► Save All ► PRINT Button ► Saves Image to File option. The SAVE LED adjacent to the PRINT button lights to indicate the alternative function.
To save a screen image to a USB flash drive, follow these steps:

1. Insert a USB flash drive into the USB Flash Drive port.

2. To change the folder designated as the current folder, push the Select Folder option button.

3. Access the screen you want to save.

4. Push the PRINT (SAVE) button.

   The oscilloscope saves the screen image and automatically generates the file name.

To see a list of the files created by the Save Image To File function, you can access the UTILITY ► File Utilities menu.

**USB Device Port**

You can use a USB cable to connect the oscilloscope to a PC, or to a PictBridge compatible printer. The USB Device port is on the rear of the oscilloscope.

![USB Device port](image)

**Installing the PC Communications Software on a PC**

Before you connect the oscilloscope to a PC, you must install the PC Communications software from the CD that came with the oscilloscope.
CAUTION. If you connect the oscilloscope to your PC before you install the software, the PC will not recognize the oscilloscope. The PC will label the oscilloscope as an Unknown Device and not communicate with the oscilloscope. To avoid this, install the software on your PC before you connect the oscilloscope to your PC.

NOTE. Be sure you have installed the same version of PC Communications software that came with the oscilloscope or a later version.

Software for your oscilloscope is also available through the Software finder on the Tektronix web site.

To install the PC Communications software, follow these steps:

1. Insert the CD-ROM that came with your oscilloscope into the CD drive on the PC. The InstallShield wizard appears on the screen.
2. Follow the on-screen directions.
3. Exit the InstallShield wizard.

Connecting to a PC

After you install the software on your PC, you can connect the oscilloscope to the PC.

NOTE. You must install the software before you connect the oscilloscope to the PC. (See page 85, Installing the PC Communications Software on a PC.)

To connect the oscilloscope to the PC, follow these steps:

1. Power on the oscilloscope.
2. Insert one end of a USB cable into the USB Device port on the back of the oscilloscope.
3. Power on the PC.
4. Insert the other end of the cable into the desired USB port on a PC.
5. If a Found New Hardware message appears, follow the on-screen directions for the Found New Hardware wizard.
Do NOT search for the hardware to install on the web.

6. For a Windows XP systems, follow these steps:

a. If you see the Tektronix PictBridge Device dialog box, click Cancel.

b. When prompted, select the option that tells Windows NOT to connect to Windows Update, and click Next.

c. In the next window, you should see that you are installing software for a USB Test and Measurement Device. If you do not see USB Test and Measurement Device software, the software that came with your oscilloscope is not properly installed.

d. Select the option that installs the software automatically (the recommended option) and click Next.

Windows will install the driver for your oscilloscope.

e. If you do not see the USB Test and Measurement Device in step c, or if Windows cannot find the software driver, the software that came with your oscilloscope is not properly installed.

In these situations, click Cancel to exit the Found New Hardware wizard. Do NOT allow the wizard to finish.

Unplug the USB cable from your oscilloscope and install the software from the CD that came with your oscilloscope.

Reconnect your oscilloscope to the PC and follow steps 6a, 6b, 6c, and 6d.

f. Click Finish.

g. If a dialog labeled Test and Measurement Device appears, select what you would like Windows to do, and click OK.

7. For Windows 2000 systems:

a. When prompted, select the option that tells Windows to display a list of known drivers and click Next.

b. In the next window, select USB Test and Measurement Device. If you do not see a USB Test and Measurement Device selection, the software that came with your oscilloscope is not properly installed.
c. In the next window, click Next to allow Windows to install the driver for your oscilloscope.

Windows will install the driver for your oscilloscope.

d. If you do not see the USB Test and Measurement Device in step b, or if Windows cannot find the software driver, the software that came with your oscilloscope is not properly installed.

In these situations, click Cancel to exit the Found New Hardware wizard. Do NOT allow the wizard to finish.

Unplug the USB cable from your oscilloscope, and install the software from the CD that came with your oscilloscope.

Reconnect your oscilloscope to the PC and follow steps 7a, 7b, and 7c.

8. When prompted, click Finish.

9. If Windows asks you to insert a CD, click Cancel.

10. Run the PC Communications software on your PC.

11. If the oscilloscope and PC do not communicate, refer to the PC Communications online help and documentation.
Connecting to a GPIB System

If you want to communicate between the oscilloscope and a GPIB system, use a TEK-USB-488 adapter and follow these steps:

1. Connect the oscilloscope to a TEK-USB-488 adapter with a USB cable.

   The Accessories appendix has information on how to order an adapter. (See page 157, Accessories.)

2. Connect the TEK-USB-488 adapter to your GPIB system with a GPIB cable.

3. Push the UTILITY ► Option ► GPIB Setup ► Address option button to select the appropriate address for the adapter, or use the multipurpose knob. The default GPIB address is 1.

4. Run your GPIB software on your GPIB system.

5. If the oscilloscope and your GPIB system do not communicate, refer to the information on the software for your GPIB system, and to the user manual for the TEK-USB-488 adapter to resolve the problem.

Command Entry

Connecting to a Printer

When you connect the oscilloscope to a PictBridge compatible printer, the oscilloscope and printer can be powered on or off. To connect the oscilloscope to a PictBridge compatible printer, follow these steps:

1. Insert one end of a USB cable into the USB Device port on the oscilloscope.
2. Insert the other end of the cable into the PictBridge port on a PictBridge compatible printer. Refer to the product documentation for your printer to locate the port.
3. To test the connection, set up the oscilloscope to print as described in the next procedure.

**NOTE.** The printer recognizes the oscilloscope only when the printer is powered on.

If the oscilloscope asks you to connect to a printer and a printer is connected, you need to power on the printer.

Printing a Screen Image

To set up a PictBridge compatible printer, follow these steps:

1. Power on the oscilloscope and the printer.
2. Push the UTILITY ➤ Options ➤ Printer Setup ➤ PRINT Button and select the Prints option.
3. Set the Ink Saver option to On, the default setting.
4. Push the - more - page 2 of 3 and - more - page 3 of 3 option buttons to set up the printer. The oscilloscope queries the printer, and only displays options and values that the printer supports.
   If you are not sure which setting to choose, select Default for each option.
5. To print a screen image, push the PRINT front panel button.
   The oscilloscope takes a few seconds to capture the screen image. The settings of your printer and print speed determine how long it
takes to print the data. Additional time may be required according to the format selected.

**NOTE.** You can use the oscilloscope while the printer prints.

6. If printing fails, check that the USB cable is connected to the PictBridge port on the printer, and try again.

**NOTE.** The oscilloscope stores these settings until you change them, even if you push the DEFAULT SETUP button, or you power off the oscilloscope.

**NOTE.** To stop sending the screen image to the printer, push **Abort Printing**.
Reference

This chapter describes the menus and operating details associated with each front-panel menu button or control.

Acquire

Push the ACQUIRE button to set acquisition parameters.

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample</td>
<td></td>
<td>Use to acquire and accurately display most waveforms; this is the default mode</td>
</tr>
<tr>

<td></td>
<td>Use to detect glitches and reduce the possibility of aliasing</td>
</tr>
<tr>
<td>Average</td>
<td></td>
<td>Use to reduce random or uncorrelated noise in the signal display; the number of averages is selectable</td>
</tr>
<tr>
<td>Averages</td>
<td>4, 16, 64, 128</td>
<td>Select number of averages</td>
</tr>
</tbody>
</table>

Key Points

If you probe a noisy square wave signal that contains intermittent, narrow glitches, the waveform displayed will vary depending on the acquisition mode you choose.

Sample Peak Detect Average

Sample. Use Sample acquisition mode to acquire 2500 points and display them at the SEC/DIV setting. Sample mode is the default mode.
Sample acquisition intervals (2500)

- Sample points

Sample mode acquires a single sample point in each interval.

The oscilloscope samples at the following rates:

- Minimum of 500 MS/s for 40 MHz models
- Maximum of 1 GS/s for 60 MHz or 100 MHz models
- Maximum of 2 GS/s for 200 MHz models

At 100 ns and faster settings, this sample rate does not acquire 2500 points. In this case, a Digital Signal Processor interpolates points between the sampled points to make a 2500 point waveform record.

**Peak Detect.** Use Peak Detect acquisition mode to detect glitches as narrow as 10 ns and to limit the possibility of aliasing. This mode is effective when at the SEC/DIV setting of 5 ms/div or slower.

Peak Detect acquisition intervals (1250)

- Sample points displayed

Peak Detect mode displays the highest and lowest acquired voltage in each interval.
**NOTE.** If you set the SEC/DIV setting to 2.5 ms/div or faster, the acquisition mode changes to Sample because the sample rate is fast enough that Peak Detect is not necessary. The oscilloscope does not display a message to tell you that the mode was changed to Sample.

When there is enough waveform noise, a typical peak detect display shows large black areas. The oscilloscope displays this area with diagonal lines to improve display performance.

![Typical peak detect display](image1)

![TDS1000B/2000B peak detect display](image2)

**Average.** Use Average acquisition mode to reduce random or uncorrelated noise in the signal you want to display. Data is acquired in sample mode, then a number of waveforms are averaged together.

Select the number of acquisitions (4, 16, 64, or 128) to average for the waveform.

**RUN/STOP Button.** Push the RUN/STOP button when you want the oscilloscope to continuously acquire waveforms. Push the button again to stop the acquisition.

**SINGLE SEQ Button.** Push the SINGLE SEQ button when you want the oscilloscope to acquire a single waveform and then stop. Each time you push the SINGLE SEQ button, the oscilloscope begins to acquire another waveform. After the oscilloscope detects a trigger it completes the acquisition and stops.

<table>
<thead>
<tr>
<th>Acquisition mode</th>
<th>SINGLE SEQ button</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample, Peak Detect</td>
<td>Sequence is complete when one acquisition is acquired</td>
</tr>
<tr>
<td>Average</td>
<td>Sequence is complete when the defined number of acquisitions is reached; (See page 93, Acquire.)</td>
</tr>
</tbody>
</table>
**Scan Mode Display.** You can use the Horizontal Scan acquisition mode (also called Roll mode) to continuously monitor signals that change slowly. The oscilloscope displays waveform updates from the left to the right of the screen and erases old points as it displays new points. A moving, one-division-wide blank section of the screen separates the new waveform points from the old.

The oscilloscope changes to the Scan acquisition mode when you turn the SEC/DIV knob to 100 ms/div or slower, and select the Auto Mode option in the TRIGGER Menu.

To disable Scan mode, push the TRIG MENU button and set the Mode option to Normal.

**Stopping the Acquisition.** While the acquisition is running, the waveform display is live. Stopping the acquisition (when you push the RUN/STOP button) freezes the display. In either mode, the waveform display can be scaled or positioned with the vertical and horizontal controls.

### Autorange

When you push the AUTORANGE button, the oscilloscope activates or deactivates the Autorange function. An LED light turns on adjacent to the AUTORANGE button that indicates when the function is active.

This function automatically adjusts setup values to track a signal. If the signal changes, the setup continues to track the signal. When you power on the oscilloscope, autoranging is always inactive.

<table>
<thead>
<tr>
<th>Options</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autoranging</td>
<td>Activates or deactivates the Autorange function; when activated the adjacent LED light turns on</td>
</tr>
<tr>
<td>Vertical and Horizontal</td>
<td>Tracks and adjusts both axes</td>
</tr>
<tr>
<td>Vertical Only</td>
<td>Tracks and adjusts the Vertical scale; does not change the horizontal settings</td>
</tr>
<tr>
<td>Horizontal Only</td>
<td>Tracks and adjusts the Horizontal scale; does not change the vertical settings</td>
</tr>
<tr>
<td>Undo Autoranging</td>
<td>Causes the oscilloscope to recall the previous setup</td>
</tr>
</tbody>
</table>
The following conditions cause autorange to adjust settings:

- Too many or too few waveform periods for a clear display of the trigger source (except when in Vertical Only)
- Waveform amplitude too large or too small (except when in Horizontal Only)
- Ideal trigger level changes

When you push the AUTORANGE button, the oscilloscope adjusts controls to produce a usable display of the input signal.

<table>
<thead>
<tr>
<th>Function</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acquire mode</td>
<td>Sample</td>
</tr>
<tr>
<td>Display format</td>
<td>YT</td>
</tr>
<tr>
<td>Display persist</td>
<td>Off</td>
</tr>
<tr>
<td>Horizontal position</td>
<td>Adjusted</td>
</tr>
<tr>
<td>Horizontal view</td>
<td>Main</td>
</tr>
<tr>
<td>RUN/STOP</td>
<td>RUN</td>
</tr>
<tr>
<td>SEC/DIV</td>
<td>Adjusted</td>
</tr>
<tr>
<td>Trigger coupling</td>
<td>DC</td>
</tr>
<tr>
<td>Trigger holdoff</td>
<td>Minimum</td>
</tr>
<tr>
<td>Trigger level</td>
<td>Adjusted</td>
</tr>
<tr>

</tr>
<tr>
<td>Vertical coupling</td>
<td>DC</td>
</tr>
<tr>
<td>Vertical invert</td>
<td>Off</td>
</tr>
<tr>
<td>VOLTS/DIV</td>
<td>Adjusted</td>
</tr>
</tbody>
</table>
The following changes to the setup of the oscilloscope deactivate autorange:

- VOLTS/DIV deactivates vertical autoranging
- SEC/DIV deactivates horizontal autoranging
- Display or remove a channel waveform
- Trigger settings
- Single Seq acquisition mode
- Recall a setup
- XY Display format
- Persistence

The Autorange function is usually more useful than Autoset in the following situations:

- Analyzing a dynamically changing signal
- Quickly comparing a sequence of several signals without adjusting the oscilloscope. This is very useful if you need to use two probes at the same time, or if you need to use a probe in one hand and are holding something else in the other.
- Controlling which settings the oscilloscope automatically adjusts

If your signals vary in frequency, but have similar amplitudes, you can use Horizontal Only autoranging. The oscilloscope will adjust the horizontal settings, but leave the vertical settings unchanged. This way, you can visually estimate the amplitude of the signal without worrying about the vertical scale changing. Vertical Only autoranging works similarly, adjusting vertical parameters and leaving the horizontal settings unchanged.

**Autoset**

When you push the AUTOSET button, the oscilloscope identifies the type of waveform and adjusts controls to produce a usable display of the input signal.
<table>
<thead>
<tr>
<th>Function</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acquire mode</td>
<td>Adjusted to Sample or Peak Detect</td>

<td>Adjusted</td>
</tr>
<tr>
<td>Vertical bandwidth</td>
<td>Full</td>
</tr>
<tr>
<td>Vertical coupling</td>
<td>DC (if GND was previously selected); AC for a video signal; otherwise, unchanged</td>
</tr>
<tr>
<td>VOLTS/DIV</td>
<td>Adjusted</td>
</tr>
</tbody>
</table>

The Autoset function examines all channels for signals and displays corresponding waveforms. Autoset also determines the trigger source based on the following conditions:

- If multiple channels have signals, the oscilloscope displays the channel with the lowest frequency signal.
- If no signals are found, then the oscilloscope displays the lowest-numbered channel when Autoset was invoked.
- If no signals are found and no channels are displayed, then the oscilloscope displays and uses channel 1.
When you use Autoset and the oscilloscope cannot determine the signal type, the oscilloscope adjusts the horizontal and the vertical scales, then takes the Mean and Pk-to-Pk automatic measurements.

The Autoset function is usually more useful than Autorange in the following situations:

- Troubleshooting one stable signal
- Automatically seeing measurements of your signal
- Easily changing how the signal is presented. For example, viewing only one cycle of the waveform, or the rising edge of the waveform
- Viewing video signals or FFT signals

**Sine Wave**

When you use the Autoset function and the oscilloscope determines that the signal is similar to a sine wave, the oscilloscope displays the following options:

<table>
<thead>
<tr>
<th>Sine wave</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Sine Wave" /></td>
<td>Displays several cycles with appropriate vertical and horizontal scaling; the oscilloscope displays Cycle RMS, Frequency, Period, and Peak-to-Peak automatic measurements</td>
</tr>
<tr>
<td>Multi-cycle sine</td>
<td>Sets the horizontal scale to display about one cycle of the waveform; the oscilloscope displays Mean, and Peak-to-Peak automatic measurements</td>
</tr>
<tr>
<td><img src="image" alt="Sine Wave" /></td>
<td>Converts the input time-domain signal into its frequency components and displays the result as a graph of frequency versus magnitude (spectrum); because this is a mathematical calculation, refer to the Math FFT chapter for more information</td>
</tr>
<tr>
<td>FFT</td>
<td>Causes the oscilloscope to recall the previous setup</td>
</tr>
</tbody>
</table>
Square Wave or Pulse

When you use the Autoset function and the oscilloscope determines that the signal is similar to a square wave or pulse, the oscilloscope displays the following options:

<table>
<thead>
<tr>
<th>Square wave or</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Multi-cycle square" /></td>
<td>Displays several cycles with appropriate vertical and horizontal scaling; the oscilloscope displays Pk-Pk, Mean, Period, and Frequency automatic measurements</td>
</tr>
<tr>
<td><img src="image" alt="Single-cycle square" /></td>
<td>Sets the horizontal scale to display about one cycle of the waveform; the oscilloscope displays Min, Max, Mean, and Positive Width automatic measurements</td>
</tr>
<tr>
<td><img src="image" alt="Rising edge" /></td>
<td>Displays the edge, and the Rise Time and Peak-to-Peak automatic measurements</td>
</tr>
<tr>
<td><img src="image" alt="Falling edge" /></td>
<td>Displays the edge, and the Fall Time and Peak-to-Peak automatic measurements</td>
</tr>
</tbody>
</table>

Undo Autoset Causes the oscilloscope to recall the previous setup

Video Signal

When you use the Autoset function and the oscilloscope determines that the signal is a video signal, the oscilloscope displays the following options:

<table>
<thead>
<tr>
<th>Video signal options</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Fields All Fields" /></td>
<td>Displays several fields and the oscilloscope triggers on any field</td>
</tr>
<tr>
<td><img src="image" alt="Lines All Lines" /></td>
<td>Displays one complete line with parts of the previous and next line; the oscilloscope triggers on any line</td>
</tr>
<tr>
<td><img src="image" alt="Lines Number" /></td>
<td>Displays one complete line with parts of the previous and next line; use the multipurpose knob to select a specific line number for the oscilloscope to use as a trigger</td>
</tr>
</tbody>
</table>
### Video signal options

<table>
<thead>
<tr>
<th>Video signal options</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Odd Fields</td>
<td>Displays several fields and the oscilloscope triggers only on odd numbered fields</td>
</tr>
<tr>
<td>Even Fields</td>
<td>Displays several fields and the oscilloscope triggers only on even numbered fields</td>
</tr>
<tr>
<td>Undo Autoset</td>
<td>Causes the oscilloscope to recall the previous setup</td>
</tr>
</tbody>
</table>

**NOTE.** *Video autoset sets the Display Type option to Dot Mode.*

### Cursor

Push the CURSOR button to display the measurement cursors and Cursor Menu, and then use the multipurpose knob to change the position of a cursor.

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Time, Amplitude, Off</td>
<td>Select and display the measurement cursors; Time measures time, frequency, and amplitude; Amplitude measures amplitude, such as current or voltage</td>
</tr>
<tr>
<td>Source</td>
<td>CH1, CH2, CH3 ², CH4 ², MATH, REFA, REFB, REFC ², REFD ²</td>
<td>Choose the waveform on which to take the cursor measurements</td>
</tr>
<tr>
<td>Δ</td>
<td>Displays the absolute value of the difference (delta) between the cursors</td>
<td></td>
</tr>
<tr>
<td>Cursor 1</td>
<td>Displays selected cursor location (time is referenced to the trigger position, and amplitude to the reference connection)</td>
<td></td>
</tr>
<tr>
<td>Cursor 2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1. For a Math FFT source, measures Frequency and Magnitude.
2. Available only on a 4-channel oscilloscope.
Delta (\(\Delta\)) values vary with the following types of cursors:

- Time cursors display \(\Delta t\), \(1/\Delta t\) and \(\Delta V\) (or \(\Delta I, \Delta VV\), and so on)
- Amplitude cursors, and Magnitude cursors (Math FFT source) display \(\Delta V\), \(\Delta I\), \(\Delta VV\), and so on
- Frequency cursors (Math FFT source) display \(1/\Delta Hz\) and \(\Delta dB\)

**NOTE.** The oscilloscope must display a waveform for the cursors and cursor readouts to appear.

**NOTE.** The oscilloscope displays the time and amplitude values for each waveform when you use Time cursors.

**Key Points**

**Cursor Movement.** Use the multipurpose knob to move Cursor 1 or Cursor 2. You can move the cursors only while the Cursor Menu is displayed. The active cursor is represented by a solid line.

![Amplitude cursors](image1.png) ![Time cursors](image2.png)

**Default Setup**

Push the DEFAULT SETUP button to recall most of the factory option and control settings, but not all. Appendix D lists the default settings that will be recalled.

**Display**

Push the DISPLAY button to choose how waveforms are presented and to change the appearance of the entire display.
### Options

<table>
<thead>

</tr>
<tr>
<td></td>
<td></td>
<td>coordinate (vertical)</td>
</tr>
<tr>
<td>Contrast</td>
<td></td>
<td>Makes it easier to distinguish a channel waveform from persistence</td>
</tr>
</tbody>
</table>

1 Use the multipurpose knob to adjust.

Depending on the type, waveforms will be displayed in three different styles: solid, dimmed, and broken.
1. A solid waveform indicates a channel (live) waveform display. The waveform remains solid when the acquisition is stopped if no controls are changed that make the display accuracy uncertain.

Changing the vertical and horizontal controls is allowed on stopped acquisitions.

2. For TDS1000B models (monochrome display), reference waveforms or waveforms with persistence appear dimmed.

For TDS2000B models (color display), reference waveforms appear white and waveforms with persistence applied appear in the same color as the Main waveform, but with less intensity.

3. A broken line indicates the waveform display no longer matches the controls. This happens when you stop the acquisition, and change a control setting that the oscilloscope is not able to apply to the displayed waveform. For example, changing the trigger controls on a stopped acquisition causes a broken-line waveform.

**Key Points**

**Persistence.** The oscilloscope displays persistence waveform data with less intensity than "live" waveform data. With Persistence set to Infinite, record points accumulate until a control is changed.
<table>
<thead>
<tr>
<th>Option</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Removes default or old waveforms whenever new waveforms display</td>
</tr>
<tr>
<td>Time limit</td>
<td>Displays new waveforms at normal intensity and old waveforms at a lower intensity; erases old waveforms when they reach the time limit</td>
</tr>
<tr>
<td>Infinite</td>
<td>Older waveforms become less bright but always remain visible; use Infinite persistence to look for infrequent events and to measure long term peak-to-peak noise</td>
</tr>
</tbody>
</table>

**XY Format.** Use the XY format to analyze phase differences, such as those represented by Lissajous patterns. The format plots the voltage on channel 1 against the voltage on channel 2, where channel 1 is the horizontal axis and channel 2 is the vertical axis. The oscilloscope uses the untriggered Sample acquisition mode and displays data as dots. The sampling rate is fixed at 1 MS/s.

**NOTE.** The oscilloscope can capture a waveform in normal YT mode at any sampling rate. You can view the same waveform in XY mode. To do so, stop the acquisition and change the display format to XY.

In XY format, the controls operate as follows:

- The channel 1 VOLTS/DIV and VERTICAL POSITION controls set the horizontal scale and position.
- The channel 2 VOLTS/DIV and VERTICAL POSITION controls continue to set vertical scale and position.
The following functions do not work in XY display format:

- Autoset (resets display format to YT)
- Autorange
- Automatic measurements

- Trigger controls

**Help**

Push the HELP button to display the Help menu. The topics cover all the menu options and controls of the oscilloscope. (See page x, Help System.)

**Horizontal**

You can use the horizontal controls to set up two views of a waveform, each with their own horizontal scale and position. The horizontal position readout shows the time represented by the center of the screen, using the time of the trigger as zero. When you change the horizontal scale, the waveform will expand or contract around the screen center.

<table>
<thead>
<tr>
<th>Options</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main</td>
<td>The main horizontal time base setting is used to display the waveform</td>
</tr>
<tr>
<td>Window Zone</td>
<td>Two cursors define a window zone</td>

<td>Adjust the Window Zone with the Horizontal Position and SEC/DIV controls</td>
</tr>
</tbody>
</table>
Options | Comments
--- | ---
Window | Changes the display to show the waveform segment (expanded to screen width) within the window zone
Set Holdoff | Displays the holdoff value; push the option button and use the multipurpose knob to adjust

**NOTE.** You can push the horizontal option buttons to switch between an entire waveform display and a zoomed part of it.

A readout near the top right of the screen displays the current horizontal position in seconds. An **M** indicates the Main time base and a **W** indicates the Window time base. The oscilloscope also indicates horizontal position with an arrow icon at the top of the graticule.

**Knobs and Buttons**

**HORIZONTAL POSITION Knob.** Use to control the position of the trigger relative to the center of the screen.

The trigger point can be set to the left or the right of the center of the screen. The maximum number of divisions to the left depends on the Horizontal Scale (time base) setting. For most scales, the maximum is at least 100 divisions. Placing the trigger point off the screen to the left is called Delayed Sweep.

**SET TO ZERO Button.** Use to set the horizontal position to zero.

**SEC/DIV Knob (Horizontal Scale).** Use to change the horizontal time scale to magnify or compress the waveform.

**Key Points**

**SEC/DIV.** If waveform acquisition is stopped (using the RUN/STOP or SINGLE SEQ button), the SEC/DIV control expands or compresses the waveform. Use to zoom in on a detail of the waveform.

**Scan Mode Display (Roll Mode).** When the SEC/DIV control is set to 100 ms/div or slower and the trigger mode is set to Auto, the oscilloscope enters the Scan acquisition mode. In this mode, the waveform display updates from left to right. There is no trigger or
horizontal position control of waveforms during scan mode. (See page 96, *Scan Mode Display.*)

**Window Zone.** Use the Window Zone option to define a segment of a waveform to see in more detail (zoom). The Window time base setting cannot be set slower than the Main time base setting.

Vertical bars define Window Zone

![Main time base displayed](image1.png) ![Window zone displayed](image2.png)

**Window.** Expands the Window Zone to cover the entire screen. Use to change between two time bases.

*NOTE.* When you change between the Main, Window Zone, and Window views, the oscilloscope erases any waveform saved on the screen through persistence. Persistence is erased with Horizontal menu changes.

**Holdoff.** Use holdoff to help stabilize the display of complex waveforms. (See page 128, *Holdoff.*)

**Math**

Push the MATH MENU button to display waveform math operations. Push the MATH MENU button again to remove math waveforms. (See page 132, *Vertical Controls.*)

1 Available only on a 4-channel oscilloscope.

**Key Points**

**Waveform Units.** The combination of source waveform units determine the resulting units for the Math waveform.
### Measure

Push the MEASURE button to access automatic measurements. There are eleven types of measurements available. You can display up to five at a time.

Push the top option button to display the Measure 1 Menu. You can choose the channel on which to take a measurement in the Source option. You can choose the type of measurement to take in the Type option. Push the Back option button to return to the MEASURE Menu and display the selected measurements.

### Key Points

**Taking Measurements.** You can display up to five automatic measurements at a time. The waveform channel must be on (displayed) to make a measurement.

Automated measurements cannot be taken on reference waveforms, or while using XY or scan mode. The measurements update about two times per second.

### Measurement type

### Print

When the **Save All ➤ PRINT Button** option is set to Prints, you can push the PRINT button to send the screen image to a printer.

You can set up the oscilloscope to send a screen image to your printer through the **UTILITY ➤ Options ➤ Printer Setup** menu.

<sup>1</sup> The printer may override your selection for best fit.

<sup>2</sup> If your selection is not supported by the printer, the oscilloscope uses the Default setting.

The alternative function of the PRINT button is to save data to a USB flash drive. (See page 77, *USB Flash Drive and Device Ports.*)

The oscilloscope was designed to print to any PictBridge compatible printer. Refer to the product documentation for your printer to determine if the printer is PictBridge compatible.

### Probe Check

You can use the Probe Check Wizard to quickly verify that your voltage probe is operating properly. (See page 5, *Voltage Probe Check Wizard.*)
Ref Menu

The Reference menu can turn on or turn off reference memory waveforms from the display. The waveforms are stored in the non-volatile memory of the oscilloscope, and have the following designations: RefA, RefB, RefC, and RefD. (RefC and RefD are only available on 4-channel oscilloscopes.)

To display (recall) or hide a reference waveform, follow these steps:

1. Push the REF MENU front panel button.

2. Push the Ref Option option button to select a reference waveform to display or hide.

Reference waveforms have the following characteristics:

- On color models, reference waveforms are displayed in white
- On monochrome models, reference waveforms are displayed at a lower intensity than "live" channel waveforms
- Two reference waveforms can be displayed at the same time
- Vertical and horizontal scale readouts display at the bottom of the screen
- Reference waveforms cannot be zoomed or panned

You can display one or two reference waveforms at the same time as "live" channel waveforms. If you display two reference waveforms, you must hide one waveform before you can display a different one.

Refer to Save Waveform for information on how to save reference waveforms. (See page 117, Save Waveform.)

Save/Recall

Push the SAVE/RECALL button to save oscilloscope setups, screen images, or waveforms, or to recall oscilloscope setups or waveforms.

The Save/Recall menu is made up of many submenus which you can access through an Action option. Each Action option displays a menu that allows you to further define the save or recall function.
Action options | Comments
--- | ---
Save All | Contains the option that configures the PRINT button to send data to a printer or to save data to a USB flash drive
Save Image | Saves a screen image to a file in a specified format
Save Setup | Saves the current oscilloscope settings to a file in a specified folder or in nonvolatile setup memory
Save Waveform | Saves the specified waveform to a file or to reference memory
Recall Setup | Recalls an oscilloscope setup file from a USB flash drive or from a location in nonvolatile setup memory
Recall Waveform | Recalls a waveform file from a USB flash drive to reference memory

Save All

The Save All action configures the PRINT button to save data to a USB flash drive, or to send data to a printer.

Options | Settings or submenus | Comments
--- | --- | ---
PRINT Button | Saves All to Files ¹ | (See page 82.)
 | Saves Image to File ¹ | (See page 84.)
 | Prints | (See page 90.)
Select Folder | Lists the contents of the current USB flash drive folder
Change Folder | (See page 79, File Management Conventions.)
New Folder | (See page 131, File Utilities for the USB Flash Drive.)
Back | Returns to the Save All menu
About Save All | Displays the help topic

¹ An LED lights adjacent to the PRINT button to indicate the alternative SAVE function that sends data to a USB flash drive.

Save Image

The Save Image action saves a screen image to a file in a specified format.
<table>
<thead>
<tr>
<th>Options</th>
<th>Settings or submenus</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Format</td>
<td>BMP, PCX, TIFF, RLE, EPSIMAGE, JPEG</td>

<td></td>
<td>Activates or deactivates Ink Saver mode</td>
</tr>
<tr>
<td>Save</td>
<td>filename (such as TEK0000.TIF)</td>
<td>Saves the screen image to the automatically generated file name in the current USB flash drive folder</td>
</tr>
</tbody>
</table>

¹ (See page 112, Print.)

When the PRINT Button option is set to Saves Image to File, the oscilloscope saves screen images to a USB flash drive when you push the SAVE button. (See page 84, Saves Image to File.)

**Save Setup**

The Save Setup action saves the current oscilloscope settings to a file named TEKnnnn.SET in a specified folder, or in nonvolatile setup memory. A setup file contains an ASCII text string that lists the oscilloscope settings.
<table>
<thead>
<tr>
<th>Options</th>
<th>Settings or submenus</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save To</td>
<td>Setup</td>
<td>Saves the current oscilloscope settings to a location in the nonvolatile setup memory</td>

<tr>
<td></td>
<td>Change Folder</td>
<td>(See page 79, File Management Conventions.)</td>
</tr>
<tr>
<td></td>
<td>New Folder</td>
<td>(See page 131, File Utilities for the USB Flash Drive.)</td>
</tr>
<tr>
<td>Save</td>
<td>filename (such as TEK0000.SET)</td>
<td>Saves the settings to the automatically generated file name in the current USB flash drive folder</td>
</tr>
</tbody>
</table>

When the PRINT Button option is set to Saves All to Files, the oscilloscope saves oscilloscope setup files to a USB flash drive when you push the SAVE button. (See page 82, Saves All to Files.)

**Save Waveform**

The Save Waveform action saves the specified waveform to a file named TEKnnnn.CSV, or to reference memory. The oscilloscope saves waveform data to files as "comma separated values" (.CSV format), which are ASCII text strings that list the time (relative to the trigger) and amplitude values for each of the 2500 waveform data points. You can import .CSV files into many spreadsheet and math analysis applications.
### Save To

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings or submenus</th>

<td></td>
</tr>
</tbody>
</table>

### Recall Waveform

The Recall Waveform action recalls a waveform file from a USB flash drive to a location in reference memory.

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings or submenus</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Ref(x)</td>
<td>Specifies the reference memory location to load the waveform to</td>
</tr>
<tr>
<td>From File</td>
<td></td>
<td>Recalls the file from the USB flash drive</td>
</tr>
</tbody>
</table>
### Options | Settings or submenus | Comments
--- | --- | ---
Select File | Lists the contents of the current USB flash drive folder and displays the next folder option.

| Change Folder | (See page 79, *File Management Conventions.*) (See page 131, *File Utilities for the USB Flash Drive.*) |

| To | Specifies the reference memory location to recall the waveform to |

| Recall | filename (such as TEK0000.CSV) | Loads the waveform from the specified file to the location in reference memory and displays the waveform |

### Key Points

**Saving and Recalling Setups.** The complete setup is stored in nonvolatile memory. When you recall the setup, the oscilloscope will be in the mode from which the setup was saved.

The oscilloscope saves the current setup if you wait three seconds after the last change before you power off the oscilloscope. The oscilloscope then recalls this setup the next time you apply power.

**Recalling the Default Setup.** You can push the DEFAULT SETUP button to initialize the oscilloscope to a known setup. To view option and control settings that the oscilloscope recalls when you push this button, refer to *Appendix D: Default Setup.*

**Saving and Recalling Waveforms.** The oscilloscope must display any waveform that you want to save. Two-channel oscilloscopes can store two reference waveforms in internal nonvolatile memory. Four-channel oscilloscopes can store four, but only display two at a time.

The oscilloscope can display both reference waveforms and channel waveform acquisitions. Reference waveforms are not adjustable, but the oscilloscope displays the horizontal and vertical scales at the bottom of the screen.
# Trigger Controls

You can define the trigger through the Trigger Menu and front-panel controls.

## Trigger Types

Three types of triggering are available: Edge, Video, and Pulse Width. A different set of options display for each type of trigger.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge (default)</td>
<td>Triggers the oscilloscope on the rising or falling edge of the input signal when it crosses the trigger level (threshold)</td>
</tr>
<tr>
<td>Video</td>
<td>Displays NTSC or PAL/SECAM standard composite video waveforms; you trigger on fields or lines of video signals. (See page 124, Video Trigger.)</td>
</tr>
<tr>
<td>Pulse</td>
<td>Triggers on aberrant pulses. (See page 125, Pulse Width Trigger.)</td>
</tr>
</tbody>
</table>

## Edge Trigger

Use Edge triggering to trigger on the edge of the oscilloscope input signal at the trigger threshold.

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge</td>
<td></td>
<td>With Edge highlighted, the rising or falling edge of the input signal is used for the trigger</td>
</tr>
<tr>
<td>Source</td>
<td>CH1, CH2, CH3, CH4, Ext, Ext/5, AC Line</td>
<td>Select the input source as the trigger signal (See page 123.)</td>
</tr>
<tr>
<td>Slope</td>
<td>Rising, Falling</td>
<td>Select to trigger on either the rising or falling edge of the signal</td>
</tr>
</tbody>
</table>
## Options

<table>
<thead>
<tr>
<th>Mode</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Auto, Normal</td>
<td>Select the type of triggering (See page 122.)</td>
</tr>
<tr>
<td>Coupling</td>
<td>AC, DC, Noise Reject, HF Reject, LF Reject</td>
<td>Selects the components of the trigger signal applied to the trigger circuitry (See page 123.)</td>
</tr>
</tbody>
</table>

1 Available only on a 4-channel oscilloscope.

### Trigger Frequency Readout

The oscilloscope counts the rate at which triggerable events occur to determine trigger frequency and displays the frequency in the lower right corner of the screen.

**NOTE.** The trigger frequency readout shows the frequency of events the oscilloscope might consider to be a trigger, and may be less than the frequency of the input signal in Pulse Width trigger mode.

### Key Points

**Mode Options.** The Auto mode (default) forces the oscilloscope to trigger when it does not detect a trigger within a certain amount of time based on the SEC/DIV setting. You can use this mode in many situations, such as to monitor the level of a power supply output.

Use the Auto mode to let the acquisition free-run in the absence of a valid trigger. This mode allows an untriggered, scanning waveform at 100 ms/div or slower time base settings.

The Normal mode updates displayed waveforms only when the oscilloscope detects a valid trigger condition. The oscilloscope displays older waveforms until the oscilloscope replaces them with new ones.

Use the Normal mode when you want to see only valid triggered waveforms. When you use this mode, the oscilloscope does not display a waveform until after the first trigger.

To perform a Single Sequence acquisition, push the SINGLE SEQ button.
Source Options.

<table>
<thead>
<tr>
<th>Source option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CH1, CH2, CH3, CH4</td>
<td>Triggers on a channel whether or not the waveform is displayed</td>
</tr>
<tr>
<td>Ext</td>
<td>Does not display the trigger signal; the Ext option uses the signal connected to the EXT TRIG front-panel BNC and allows a trigger level range of +1.6 V to -1.6 V</td>
</tr>
<tr>
<td>Ext/5</td>
<td>Same as Ext option, but attenuates the signal by a factor of five, and allows a trigger level range of +8 V to -8 V; this extends the trigger level range</td>
</tr>
<tr>
<td>AC Line</td>
<td>Uses a signal derived from the power line as the trigger source; trigger coupling is set to DC and the trigger level to 0 volts. You can use the AC Line when you need to analyze signals related to the frequency of the power line, such as lighting equipment and power supply devices; the oscilloscope automatically generates the trigger, sets the Trigger Coupling to DC, and sets the Trigger Level to zero volts.</td>
</tr>
</tbody>
</table>

1 Available only on a 4-channel oscilloscope.
2 Available only when you select the Edge trigger type.

**NOTE.** To view an Ext, Ext/5, or AC Line trigger signal, push and hold down the TRIG VIEW button.

Coupling. Coupling allows you to filter the trigger signal used to trigger an acquisition.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC</td>
<td>Passes all components of the signal</td>
</tr>
<tr>
<td>Noise Reject</td>
<td>Adds hysteresis to the trigger circuitry; this reduces sensitivity which reduces the chance of falsely triggering on noise</td>
</tr>
<tr>
<td>HF Reject</td>
<td>Attenuates the high-frequency components above 80 kHz</td>
</tr>
</tbody>
</table>
**Option** | **Details**
--- | ---
LF Reject | Blocks the DC component and attenuates the low-frequency components below 300 kHz
AC | Blocks DC components and attenuates signals below 10 Hz

**NOTE.** Trigger coupling affects only the signal passed to the trigger system. It does not affect the bandwidth or coupling of the signal displayed on the screen.

**Pretrigger.** The trigger position is typically set at the horizontal center of the screen. In this case, you are able to view five divisions of pretrigger information. Adjusting the Horizontal Position of the waveform allows you to see more or less pretrigger information.

**Video Trigger**

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video</td>
<td>With Video highlighted, triggering occurs on an NTSC, PAL, or SECAM standard video signal</td>
<td>Trigger coupling is preset to AC</td>
</tr>
<tr>
<td>Source</td>
<td>CH1, CH2, CH3, CH4, Ext, Ext/5</td>
<td>Selects the input source as the trigger signal; Ext and Ext/5 selections use the signal applied to the EXT TRIG connector</td>
</tr>
<tr>
<td>Polarity</td>
<td>Normal, Inverted</td>
<td>Normal triggers on the negative edge of the sync pulse; Inverted triggers on the positive edge of the sync pulse</td>
</tr>
</tbody>
</table>
Options  | Settings                          | Comments                                                                 |
---      | ---                              | ---                                                                       |
Sync     | All Lines, Line Number, Odd Field, Even Field, All Fields | Select an appropriate video sync Use the multipurpose knob to specify a line number when you select Line Number for the Sync option |
Standard | NTSC, PAL/SECAM                   | Select the video standard for sync and line number count                   |

1 Available only on a 4-channel oscilloscope.

**Key Points**

**Sync Pulses.** When you choose Normal Polarity, the trigger always occurs on negative-going sync pulses. If your video signal has positive-going sync pulses, use the Inverted Polarity selection.

**Pulse Width Trigger**

Use Pulse Width triggering to trigger on normal or aberrant pulses.

Options  | Settings                     | Comments                                                                 |

--- | --- | ---
Mode | Auto, Normal | Select the type of triggering; Normal mode is best for most Pulse Width trigger applications

Coupling | AC, DC, Noise Reject, HF Reject, LF Reject | Selects the components of the trigger signal applied to the trigger circuitry; (See page 121, Edge Trigger.)

More | | Use to switch between submenu pages

1 Available only on a 4-channel oscilloscope.

**Trigger Frequency Readout**

The oscilloscope counts the rate at which trigger events occur to determine trigger frequency and displays the frequency in the lower right corner of the screen.

**Key Points**

**Trigger When.** The pulse width of the source must be ≥5 ns for the oscilloscope to detect the pulse.

<table>
<thead>
<tr>
<th>When options</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Triggers the oscilloscope when the signal pulse width is equal to or not equal to the specified pulse width within a ± 5% tolerance</td>
</tr>
<tr>
<td>≠</td>
<td></td>
</tr>
<tr>
<td>&lt;</td>
<td>Triggers the oscilloscope when the source signal pulse width is less than or greater than the specified pulse width</td>
</tr>
<tr>
<td>&gt;</td>
<td></td>
</tr>
</tbody>
</table>
Reference

Refer to the Application Examples chapter for an example of triggering on aberrant pulses. (See page 54, Triggering on a Specific Pulse Width.)

Knobs and Buttons

LEVEL Knob. Use to control the Trigger Level.

SET TO 50% Button. Use the SET TO 50% button to quickly stabilize a waveform. The oscilloscope automatically sets the Trigger Level to be about halfway between the minimum and maximum voltage levels. This is useful when you connect a signal to the EXT TRIG BNC and set the trigger source to Ext, or Ext/5.

FORCE TRIG Button. Use the FORCE TRIG button to complete the waveform acquisition whether or not the oscilloscope detects a trigger. This is useful for SINGLE SEQ acquisitions and Normal trigger mode. (In Auto trigger mode, the oscilloscope automatically forces triggers periodically if it does not detect a trigger.)

TRIG VIEW Button. Use the Trigger View mode to display the conditioned trigger signal on the oscilloscope. You can use this mode to see the following types of information:
Effects of the Trigger Coupling option

AC Line trigger source (Edge Trigger only)

Signal connected to the EXT TRIG BNC

**NOTE.** This is the only button that you must hold down to use. When you hold down the TRIG VIEW button, the only other button you can use is the PRINT button. The oscilloscope disables all other front-panel buttons. The knobs continue to be active.

**Holdoff.** You can use the Trigger Holdoff function to produce a stable display of complex waveforms, such as pulse trains. Holdoff is the time between when the oscilloscope detects one trigger and when it is ready to detect another. The oscilloscope will not trigger during the holdoff time. For a pulse train, you can adjust the holdoff time so the oscilloscope triggers only on the first pulse in the train.

To use Trigger Holdoff, push the **HORIZ MENU ➤ Set Holdoff** option button and use the multipurpose knob to adjust the holdoff. The resolution of the trigger holdoff varies depending on the Horizontal SEC/DIV setting.

**Utility**

Push the UTILITY button to display the Utility Menu.
## Summary of the oscilloscope settings

<table>

### Do Self Cal
Performs a self calibration

### File Utilities
Displays folder, file, and USB flash drive options (See page 131.)

### Language
Selects the display language of the oscilloscope

- English, French, German, Italian, Spanish, Japanese, Portuguese, Simplified Chinese, Traditional Chinese, Korean

1 Monochrome models only.

### Key Points

**System Status.** Selecting System Status from the Utility Menu displays the menus available for obtaining a list of control settings for each group of oscilloscope controls.

Push any front-panel menu button to remove the status screen.
Setting the Date and Time. You can use the Set Date and Time menu to set the clock date and time. The oscilloscope displays this information, and also uses it to time stamp files written to a USB flash drive. The oscilloscope contains a built-in nonreplaceable battery to maintain the clock settings.

The clock does not automatically adjust for seasonal time changes. The calendar does adjust for Leap years.

Self Calibration. The self calibration routine optimizes the oscilloscope accuracy for the ambient temperature. For maximum accuracy, perform a self cal if the ambient temperature changes by 5 °C (9 °F) or more. For accurate calibration, power on the oscilloscope and wait twenty minutes to ensure it is warmed up. Follow the directions on the screen.

Factory calibration uses externally-generated voltages, and requires specialized equipment. The recommended interval is one year. See Contacting Tektronix on the copyright page for information on having Tektronix perform a Factory Calibration of your oscilloscope.
File Utilities for the USB Flash Drive

One folder is always designated as the current folder. The current folder is the default location to save and recall files.

You can use the File Utilities menu to do the following tasks:

- List the contents of the current folder
- Select a file or folder
- Navigate to other folders
- Create, rename, and delete files and folders
- Format a USB flash drive

<table>
<thead>
<tr>
<th>Options</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Folder</td>
<td>Navigates to the selected USB flash drive folder. Use the multipurpose knob to select a file or folder, then select the Change Folder menu option. To return to the previous folder, select the ↑Up folder item and then select the Change Folder menu option.</td>
</tr>
<tr>
<td>New Folder</td>
<td>Creates a new folder in the current folder location, named NEW_FOL, and displays the Rename menu for changing the default folder name.</td>
</tr>
<tr>
<td>Rename (filename or folder)</td>
<td>Displays the Rename screen to rename a folder or file, described next.</td>
</tr>
<tr>
<td>Delete (filename or folder)</td>
<td>Deletes the selected file name or folder; a folder must be empty before you can delete it.</td>
</tr>
<tr>
<td>Confirm Delete</td>
<td>Displays after pressing Delete, to confirm a file delete action. Pressing any button or knob other than Confirm Delete cancels the file delete action.</td>
</tr>
<tr>
<td>Format</td>
<td>Formats the USB flash drive; this deletes all data on the USB flash drive.</td>
</tr>
<tr>
<td>Update Firmware</td>
<td>Follow the on-screen directions to set up and push the Update Firmware option button to start updating firmware.</td>
</tr>
</tbody>
</table>

Rename File or Folder. You can change the names of files and folders on a USB flash drive.
### Reference

#### Option Settings Comments

</tbody>
</table>

### Vertical Controls

You can use the vertical controls to display and remove waveforms, adjust vertical scale and position, set input parameters, and for vertical math operations. (See page 109, *Math.*)

### Channel Vertical Menus

There is a separate vertical menu for each channel. Each option is set individually for each channel.

<table>
<thead>
<tr>
<th>Options</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coupling</td>
<td>DC, AC, Ground</td>
<td>DC passes both AC and DC components of the input signal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>AC blocks the DC component of the input signal and attenuates signals below 10 Hz</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Ground disconnects the input signal</td>
</tr>
</tbody>
</table>
Options | Settings | Comments
--- | --- | ---
BW Limit | 20 MHz\(^1\), Off | Limits the bandwidth to reduce display noise; filters the signal to reduce noise and other unwanted high frequency components

Volts/Div | Coarse, Fine | Selects the resolution of the Volts/Div knob

Coarse defines a 1-2-5 sequence. Fine changes the resolution to small steps between the coarse settings

Probe | See the next table | Push to adjust Probe options

Invert | On, Off | Inverts (flips) the waveform with respect to the reference level

\(^1\) Effective bandwidth is 6 MHz with a P2220 probe set to 1X.

The option for voltage and current probes is different: Attenuation or Scale.

<table>
<thead>
<tr>
<th>Probe options</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe ► Voltage ► Attenuation</td>
<td>1X, 10X, 20X, 50X, 100X, 500X, 1000X</td>
<td>Set to match the attenuation factor of the voltage probe to ensure correct vertical readouts</td>
</tr>
</tbody>
</table>

| Probe ► Current ► Scale | 5 V/A, 1 V/A, 500 mV/A, 200 mV/A, 100 mV/A, 20 mV/A, 10 mV/A, 1 mV/A | Set to match the scale of the current probe to ensure correct vertical readouts |

Back | Returns to the previous menu |

**Knobs**

**VERTICAL POSITION Knobs.** Use the VERTICAL POSITION knobs to move the channel waveforms up or down on the screen.

**VOLTS/DIV Knobs.** Use the VOLTS/DIV knobs to control how the oscilloscope amplifies or attenuates the source signal of channel
waveforms. When you turn a VOLTS/DIV knob, the oscilloscope increases or decreases the vertical size of the waveform on the screen.

**Vertical Measurement Overrange (Clipping).** Waveforms that extend beyond the screen (overrange) and display a ? in the measurement readout indicates an invalid value. Adjust the vertical scaling to ensure the readout is valid.

**Key Points**

**Ground Coupling.** Use Ground coupling to display a zero-volt waveform. Internally, the channel input is connected to a zero-volt reference level.

**Fine Resolution.** The vertical scale readout displays the actual Volts/Div setting while in the fine resolution setting. Changing the setting to coarse does not change the vertical scale until the VOLTS/DIV control is adjusted.

**Remove Waveform.** To remove a waveform from the display, push a channel menu front panel button. For example, push the CH 1 MENU button to display or remove the channel 1 waveform.

---

**NOTE.** You do not have to display a channel waveform to use it as a trigger source or for math operations.

---

**NOTE.** You must display a channel waveform to take measurements from it, use cursors on it, or to save it as a Reference waveform or to a file.
Appendix A: Specifications

All specifications apply to the TDS1000B and TDS2000B series models. P2220 probe specifications appear at the end of this chapter. To verify that the oscilloscope meets specifications, the oscilloscope must first meet the following conditions:

- The oscilloscope must have been operating continuously for twenty minutes within the specified operating temperature.
- You must perform the Do Self Cal operation, accessible through the Utility menu, if the operating temperature changes by more than 5 °C (9 °F ).
- The oscilloscope must be within the factory calibration interval.

All specifications are guaranteed unless noted “typical.”

</tr>
</tbody>
</table>

Installation Category II; derate at 20 dB/decade above 100 kHz to 13 V peak AC at 3 MHz<sup>1</sup> and above. For non-sinusoidal waveforms, peak value must be less than 450 V. Excursion above 300 V should be less than 100 ms duration and the duty factor is limited to ≤ 44%. RMS signal level including any DC component removed through AC coupling must be limited to 300 V. If these values are exceeded, damage to the instrument may result. Refer to the *Overvoltage Category* description above.
### Table 2: Input Specifications, (cont.)

<table>

---

### Oscilloscope Certifications and Compliances

**EC Declaration of Conformity - EMC**

Meets intent of Directive 89/336/EEC for Electromagnetic Compatibility. Compliance was demonstrated to the following specifications as listed in the Official Journal of the European Communities:

**EN 61326.** EMC requirements for Class A electrical equipment for measurement, control, and laboratory use.
IEC 61000-4-2. Electrostatic discharge immunity (Performance criterion B)

IEC 61000-4-3. RF electromagnetic field immunity (Performance criterion A)

IEC 61000-4-4. Electrical fast transient / burst immunity (Performance criterion B)

IEC 61000-4-5. Power line surge immunity (Performance criterion B)

IEC 61000-4-6. Conducted RF immunity (Performance criterion A)

IEC 61000-4-11. Voltage dips & interruptions immunity (Performance criterion B)

EN 61000-3-2. AC power line harmonic emissions

EN 61000-3-3. Voltage changes, fluctuations, and flicker

1 Emissions which exceed the levels required by this standard may occur when this equipment is connected to a test object.

**Australia / New Zealand Declaration of Conformity - EMC**

Complies with EMC provision of Radiocommunications Act per these standard(s):

- AS/NZS 2064.1/2. Industrial, Scientific, and Medical Equipment: 1992

**EMC Compliance**

Meets the intent of Directive 89/336/EEC for Electromagnetic Compatibility when it is used with the product(s) stated in the specifications table. Refer to the EMC specification published for the stated products. May not meet the intent of the directive if used with other products.

**FCC Compliance**

Emissions comply with FCC 47 CFR, Part 15, Subpart B for Class A equipment.
Appendix A: Specifications

Russian Federation

This product was certified by the GOST ministry of Russia to be in compliance with all applicable EMC regulations.

EC Declaration of Conformity - Low Voltage

Compliance was demonstrated to the following specification as listed in the Official Journal of the European Communities:

- EN 61010-1:2001. Safety requirements for electrical equipment for measurement control and laboratory use.

U.S. Nationally Recognized Testing Laboratory Listing

Canadian Certification

Appendix A: Specifications

Additional Compliance

Equipment Type

Test and measuring equipment.

Safety Class

Class 1 - grounded product

Pollution Degree Descriptions

A measure of the contaminates that could occur in the environment around and within a product. Typically the internal environment inside a product is considered to be the same as the external. Products should be used only in the environment for which they are rated.

- Pollution Degree 1. No pollution or only dry, nonconductive pollution occurs. Products in this category are generally encapsulated, hermetically sealed, or located in clean rooms.
- Pollution Degree 2. Normally only dry, nonconductive pollution occurs. Occasionally a temporary conductivity that is caused by condensation must be expected. This location is a typical office/home environment. Temporary condensation occurs only when the product is out of service.
- Pollution Degree 3. Conductive pollution, or dry, nonconductive pollution that becomes conductive due to condensation. These are sheltered locations where neither temperature nor humidity is controlled. The area is protected from direct sunshine, rain, or direct wind.
- Pollution Degree 4. Pollution that generates persistent conductivity through conductive dust, rain, or snow. Typical outdoor locations.
Installation (Overvoltage) Category Descriptions

Terminals on this product may have different installation (overvoltage) category designations. The installation categories are:

- Measurement Category II (CAT II). For measurements performed on circuits directly connected to the low-voltage installation (MAINS).
- Measurement Category I (CAT I). For measurements performed on circuits not directly connected to MAINS.

<td>The P6101B probe has a 15 MHz bandwidth with a rating of $300 V_{\text{RMS}}$ CAT II.</td>
</tr>
<tr>
<td><strong>RM2000B Rackmount Kit.</strong></td>
<td>The RM2000B Rackmount Kit lets you install a TDS1000B or TDS2000B series oscilloscope into an industry-standard 19 inch rack. The rackmount kit requires seven inches of vertical rack space. You can turn the oscilloscope power on or off from the front of the rackmount kit. The rackmount kit does not have slide-out capability.</td>
</tr>
<tr>
<td><strong>P2220 1X, 10X Probe Instructions</strong></td>
<td>The P2220 probe manual (071-1464-XX, English) provides information on the probe and probe accessories.</td>
</tr>
</tbody>
</table>
Appendix B: Accessories

TDS1000B and TDS2000B Series Digital Storage Oscilloscope User Manuals. The user manual is available in these languages:
- English, 071-1817-XX
- French, 071-1818-XX
- Italian, 071-1819-XX
- German, 071-1820-XX
- Spanish, 071-1821-XX
- Japanese, 071-1822-XX
- Portuguese, 071-1823-XX
- Simplified Chinese, 071-1824-XX
- Traditional Chinese, 071-1825-XX
- Korean, 071-1826-XX
- Russian, 071-1827-XX

International Power Cords. In addition to the power cord shipped with your oscilloscope, you can obtain the following cords:
- Option A0, North American 120 V, 60 Hz, 161-0066-00
- Option A1, European 230 V, 50 Hz, 161-0066-09
- Option A2, United Kingdom 230 V, 50 Hz, 161-0066-10
- Option A3, Australian 240 V, 50 Hz, 161-0066-11
- Option A5, Switzerland 230 V, 50 Hz, 161-0154-00
- Option A10, China 220 V, 50 Hz, 161-0304-00
- Option A11, India 230 V, 50 Hz, 161-4000-00

TEK-USB-488 Adapter. The GPIB adapter allows you to connect your oscilloscope to a GPIB controller.
**Appendix B: Accessories**

| **Soft Case.** The soft case (AC2100) protects the oscilloscope from damage and provides space for probes, a power cord, and manuals. |
| **Transit Case.** The transit case (HCTEK4321) provides shock, vibration, impact and moisture protection for the oscilloscope when you transport it from one place to another. The required soft case fits inside the transit case. |
Appendix C: Cleaning

General Care

Do not store or leave the oscilloscope where the LCD display will be exposed to direct sunlight for long periods of time.

\(\text{CAUTION. To avoid damage to the oscilloscope or probes, do not expose them to sprays, liquids, or solvents.}\)

Cleaning

Inspect the oscilloscope and probes as often as operating conditions require. To clean the exterior surface, perform the following steps:

1. Remove loose dust on the outside of the oscilloscope and probes with a lint-free cloth. Use care to avoid scratching the clear glass display filter.

2. Use a soft cloth dampened with water to clean the oscilloscope. Use an aqueous solution of 75% isopropyl alcohol for more efficient cleaning.

\(\text{CAUTION. To avoid damage to the surface of the oscilloscope or probes, do not use any abrasive or chemical cleaning agents.}\)
Appendix D: Default Setup

This appendix describes the options, buttons and controls that change settings when you push the DEFAULT SETUP button. The last page of this appendix lists settings that do not change.

**NOTE.** When you push the DEFAULT SETUP button, the oscilloscope displays the CH1 waveform and removes all other waveforms.
