*Fields of moduli of homology or orbifolds with signature  $(0;A;B;C;D)$*

Rubén Hidalgo

Universidad Técnica Federico Santa María, Chile

### Resumen:

Every non-singular irreducible projective algebraic curve admits, by the implicit function theorem, a natural structure of a closed Riemann surface and, conversely, as a consequence of the Riemann-Roch theorem, every closed Riemann surface can be described by some nonsingular irreducible projective algebraic curve. This interplay, permits to study closed Riemann surfaces from a point of view of complex analysis and also from an algebraic point of view. In particular, the group  $\text{Aut}(\mathbb{C})$  of fields automorphisms of the field  $\mathbb{C}$  of complex numbers acts on the moduli space of closed Riemann surfaces. To understand such a dynamic is a very difficult task. To each (conformal class of a) closed Riemann surface  $S$ , there is associated the stabilizer subgroup  $G$  of the conformal class of  $S$ . The fixed field of  $G$ , say  $M(S)$ , is called the field of moduli of  $S$ . It is well known that if  $S$  can be described by an algebraic curve over a subfield  $K$  of  $\mathbb{C}$  (we say that  $K$  is a field of definition of  $S$ ), then  $M(S)$  is a subfield of  $K$ . In general,  $M(S)$  is not a field of definition of  $S$ . Weil's theorem provides necessary and sufficient conditions for  $M(S)$  to be a field of definition for  $S$ . Let  $\text{Aut}(S)$  be the group of conformal automorphisms of  $S$ . If  $\text{Aut}(S)$  is trivial, then such conditions hold trivially and  $M(S)$  is a field of definition. Unfortunately, such conditions are in general difficult to see if  $\text{Aut}(S)$  is non-trivial. If  $S/\text{Aut}(S)$  is an orbifold with signature of the form  $(0;a,b,c)$  [ $S$  is called a quasilatonic surface], then  $S$  can be defined over its field of moduli.

In this talk, I plan to recall the definition of fields of moduli and fields of definitions of a closed Riemann surface and to discuss the above for the case when  $S/\text{Aut}(S)$  has signature  $(0;a,b,c,d)$ .
